As The Editor Sees It

Herbert Hoover, Secretary of Commerce, in response to many requests from newspapers and magazines for a statement of conditions and prospects for the coming year, issued the following statement.

A reply to requests for opinion on the New Year's economic prospects can only be based on the economic currents already born of the old year. New and unknown currents will enter in the new year, so there is no such thing as assured economic prophecy.

No one will deny that 1926 has shown the highest total production and consumption of industrial commodities of any year in the history of the United States. Except in the textile industry and parts of the coal industry, it has been a year of high degree of employment, which has been accompanied by the highest peak in real wages, because wage income for the country as a whole has slightly increased and cost of living slightly decreased during the year. Manufacturing, the service industries, and commerce generally have continued to improve their methods, to reduce costs, and to improve services. In aggregate each industry appears to show substantial profits except the textile and some parts

of the coal industry. While there has been a slackening in production and demand for several staple lines during the past few weeks, we enter the new year with no consequential overstock of manufactured goods. With the largest volume of construction during the past year ever known there may prove to be some construction in advance of immediate needs, but slackening in this direction may be partially compensated by the assurance of a larger amount of public construction during the next year. Savings of the country have shown a steady increase and there is ample cheap capital available.

The lag of agricultural recovery has continued and has been accentuated by distressing crop failures in some localities. Cotton and some fruit crops beyond world demand have brought about prices below the cost of production of large areas of those commodities. There is a consequent lowered buying power in some agricultural sections.

Taking the foreign field as a whole, it shows continued progress toward balance of budgets; reduction of floating debt; greater stability in currency; and somewhat diminished unemployment. The most important exception has been the results of the British coal strike which

left the world poorer by its interruption to the progress of that country, but this is now happily over. Russia shows some economic improvement; and China, due to international trade relations, still continues below normal. Each year sees progress in European political relations with fear less and less a dominating factor.

Combining all foreign and domestic tendencies with which we enter the New Year, while some of them are not so good as we could wish, others are most hopeful. To those who are interested in the movement of the business cycle, it is worth remarking that we have had no inflation in commodities as prices have decreased rather than increased during the year. Moreover, the elasticity of credit through the Federal Reserve System, the absence of undue stocks of commodities, the greatly enlarged information services of the country and wider understanding, (and thus better common judgment and caution) are all protections against violent movements, such as we experienced in former times.

The nation is making economic progress. Some areas lag behind others, and discontent with the lag is an assurance of a lively sense of initiative and the

best promise of remedy. Each individual tests the question of prosperity by his own setting and naturally applies his own test to his views of the economic state of the nation. If we use the more precise term "economic progress" we find we have per capita as the result of the year 1926 more and better homes, more electric lights and power, more transportation, more roads, more substantial buildings, more radios and more automobiles, more savings, more life insurance and more of a lot of things. We also have more educational facilities and more per capita circulation of newspapers and magazines than ever before.

Altogether we enter the New Year with a job in prospect for most everybody, with the whole nation better fed, better housed, and better clothed than any other nation. The large disappearance of poverty in the chronic sense should make us more sensible to the remedy of misfortune in the individual sense, and the high recovery of industry and commerce from the losses of the war should make us more sensible of the needs of agriculture.

Construction operations in the United States set a new record in 1926. The volume of these operations during the year just concluded was 2 percent. greater than the similar figure registered for 1925, when all previous records were broken, according to statistics made public by the Associated General Contractors of America.

Expenditure of \$7,500,000,000 is estimated to have been involved in construction operations last year. Of this total,

\$5,500,000,000 was spent for construction of dwellings, office buildings and other commercial and industrial structures. The expenditure for highway construction and maintenance is estimated to have been in excess of \$1,000,000,000, with a similar amount involved in construction of public works and the building operations of public utilities.

The volume of construction work carried on during December was the greatest ever recorded for that month of the year. This unprecedented December activity was in keeping with the present tendency toward increased "cold weather" operations. Although a sharp decline from the November figure was shown last month, the volume indicated for the last 31 days of 1926 was 4 per cent. greater than the volume registered for December, 1925.

The December volume reached the 162 level on a scale which places the 1913 average at 100 as its basis. The average of the December volumes registered during the preceding five years is indexed at 137. This shows that the volume of construction last month was 25 points above the average for that month during half a decade and indicates the degree in which low temperatures are being defied by construction operations this season.

The high mark of 1926 was reached in July, when the 228 level was attained, while the figure of 117, which was registered in February, was the lowest of the year. The distance between the extreme "high" and the extreme "low" in 1926 was almost exactly equal to the corresponding range noted in 1925. The July volume was the greatest ever recorded for a single month.

INDUSTRIAL HEADS PREDICT CONTINUED PROSPERITY FOR 1927—BUSINESS NEARLY ON CASH BASIS—FINANCIAL PANICS ELIMINATED

Directors of the National Association of Manufacturers in Various Parts of the Country Point to Specific Causes of Unprecedented Flow of Business and Appeal For Continued Application to the Task of Maintaining Our World Position

Looking back over the year of 1926 and forecasting the business outlook for 1927, directors and members of the National Association of Manufacturers predict a continuance of the unprecedented prosperity of the nation. They see only a few economic icebergs in the path of the ship of Success.

They point to these outstanding facts:

1. Business is nearer to a cash basis than it ever has been in our history.
2. No financial panic can come—the Federal Reserve Banking System stands as an indestructible buffer.

The Parthenon

Athens, Greece

WORLD FAMOUS STRUCTURES

THE Parthenon, at Athens, Greece, stands upon the highest platform of the Acropolis. It is entirely constructed of white marble from the quarries of Mount Pentelicus and was completed in the year 438 B. C.

The Parthenon was never intended as a temple of worship, but was built as a tribute to the national deity, Athena Parthenos. It was also the central point of the Panathenaic festival and served as a storehouse for the sacred treasures.

7. People generally are contented and there are gradually fewer labor disturbances.

Individual opinions follow:

By JOHN E. EDGERTON

President, National Association of Manufacturers

Government officials who know, individual economists, and private reports all tell us our country is in the finest position we have ever known; that we have attained a new national standard of living. Recent surveys made by the National Association of Manufacturers among its members, support this appraisal amply. Ninety-nine per cent. of our members are planning for better business in 1927 than they had in 1926, classifying their chances variously as from excellent down to fair. Only one per cent. takes a pessimistic view and anticipates a decline. Seventy-five per cent. have recorded better business for 1926 than they had in 1925. Sixty-eight per cent. have increased their forces; and eighty-nine per cent. are paying higher wages this year than last year.

Excellent reason for being optimistic! But with all of this I want to sound a note of caution against becoming panicky when we see our prosperity easing off in certain spots. It is bound to come, for we are closer to the basis of just costs all around than we have ever been since the war. Within the last six months I have travelled through nearly three-fourths of the states of the Union, and have talked to and with thousands of industrial and business men. I find in some places, tendencies toward gloom; but, also I find in these places a little over-building, over-growing, over-production. Those things must, and will, find their stable bases, a more even relation between production and consumption, as exists in the great bulk of our standard lines of business that have gone on and on for decades and must always go on.

Let us analyze ourselves a little. Look back a decade or so ago. In 1906 the United States Census showed that we had 86,000,000 in our national family. Today we have approximately 116,000,000. In 1906 the automobile (the greatest toy and at the same time the most useful invention of the age), was in its infancy, a plaything for the wealthy and only a few in operation. Today it is a necessity for 10,000,000 and a luxury-necessity for 10,000,000 more. A decade ago we had no airplanes; that industry was in its infancy. We had no dirigibles. We had no radios. We had only a few hotel palaces; we had few vestibule trains. Today modern hotel palaces are everywhere; the de-luxe method of train service is universal for all classes. Our sports were very few with a small following. Today we have a widespread interest in sports and they have become

a regular business.

All this means that we have grown to man's estate as a nation and have a large family to support and maintain on a plane that our forefathers never enjoyed or knew. It means that, more than at any time in history, the need for sober, sane application to business and work must prevail.

The United States today has an annual crime bill of \$10,000,000,000. We are the most criminal nation in the world. We should give continuing thought to the fact that there is a keener relationship between crime and leisure than there is between crime and the necessity for work.

When nations turn to pleasure, they crumble. Idleness destroys and when idleness becomes the business of those who make, mould and rule nations, there can be only one harvest—ruin. That has been the story of civilization; and now, in our most favored position, it behooves us to give more thought to constructive progress and to hold the respect of the world.

By A. H. MULLIKEN

President, Pettibone Mulliken Company, Chicago, and director, National Association of Manufacturers.

The business situation during the eleven months of 1926 has been entirely different, in regard to demand and production, than ever before in the history of this country.

In the steel industry, and many other industries, it has heretofore been considered essential to have a backlog of orders from three to six months. During the period just mentioned, no industry has had over thirty days' accumulation of orders and, in many branches of the steel industry—which is more surprising—at no time has there been over two weeks' orders on the books.

This is a radical change in the business of the country. It extends to all branches of industry. It really puts business on a sounder basis than ever before; it has reduced inventories; it has prevented speculation in material; it has reduced credits; it has reduced bank loans; and, by working from hand to mouth, it has brought business nearer to a cash basis than it has ever been.

This situation has been due almost entirely to the wonderful improvement in railway transportation and the more efficient railway service. In fact, I believe it would have been impossible for this condition to prevail without this splendid railway management.

Prices of nearly all materials have been stabilized at fair figures. There has been no price excitement. Compared with the past, quotations for all classes of goods have been based on normal costs. It would seem impossible for shrinkage in inven-

tories to occur that would affect business. The Federal Reserve system will prevent a money panic.

The only situation in which there seems to be abnormal expansion is in building, which, if properly controlled, could be gradually decreased without disturbing general business relations.

I see no reason why the present prosperity should not continue indefinitely. I do not believe in the theory that, sooner or later, business conditions must fluctuate either up or down.

The whole tendency of modern thought is to stabilize prices, stabilize demand—expanded only as required by the necessities of the people—and avoid all undue expansion, abnormal conditions, and business reactions, so that the old-fashioned feast and famine shall never return.

These pessimists who are constantly looking for trouble, do more harm than good. People generally find what they are looking for and, as it has been said, "those who expect to fail generally do fail."

Success in business, as well as success in life, is due to optimism. Optimism, guided by experience, in my opinion, is a sure road to success.

A man who expects to fail generally does fail.

By WILLIAM C. COLEMAN

President, the Bucyrus Company, South Milwaukee, Wis.

The Secretary of the Treasury, the Secretary of Commerce and many other eminent authorities have attested to the great prosperity of the country prevailing in 1926 and have indicated that a continuance of this condition may be expected throughout 1927.

If these forecasts are correct, and I see no particular reason to doubt them, it behooves us to take stock of the situation and plan to do those things which will tend to promote a continued high rate of production with its resultant prosperity rather than assume that prosperity is assured and allow ourselves to drift into a state where such prosperity will be seriously menaced.

The prosperity of the past year may be measured by the relatively large earnings and this has in turn depended upon a number of factors—among them, a large volume of production and high wages (as measured by past standards), but accompanying them have been increasing costs of marketing products and narrowing margins of profit.

If this brief analysis is correct and we wish our prosperous condition to continue, what should be our obvious course?

1st. An intensive study of costs to reduce them by every possible means.

If this can be done we will be in a position to tide over a period of reduced production—if that should come—and still maintain margins of profits.

2nd. Maintenance of present wage rates and prices of product.

If volume continues at the high rate of 1926, reduced costs would lead to reduced prices, thus further stimulating business.

A history of the course of business activity would probably show that most periods of prosperity were stifled by flagrant opportunism rather than by anything else and if this is true, why not avoid it?

By P. O. GEIER

President, Cincinnati Grinders Incorporated, Cincinnati, O., and director National Association of Manufacturers.

The volume of manufacturing activity for 1927 should be approximately that of 1926. Some industries will probably show a decrease of activity, among them that of the automobile industry, although even here unforeseen conditions may make it possible to have next year's totals equal this year's output.

The railroads, due to their excellent financial condition and also due to the fact that a heavy strain has been put upon their present equipment during the past three years, will undoubtedly place a considerable amount of orders for equipment. Industrial machinery should prove to be active. 1927 will be a year in which costs must be still further reduced. Costs of distribution and selling will be carefully analyzed, but the major saving must still be looked for in the cost of production. There are certain types of labor saving devices and tools which can profitably be installed, no matter what may be the period of the business cycle. Manufacturers of equipment of this nature may look for excellent business. Those who concentrate their sales efforts on the fields in which the greatest opportunities lie for increasing production and lowering costs will profit accordingly. General business should produce a very satisfactory volume of orders—but these will undoubtedly be more difficult to obtain and will require greater efficiency in shop and office alike.

By D. M. WEIR

Vice-President, Weirton Steel Company, Weirton, W. Va.

While at the present time there is some dropping off in the volume of business, except in such lines as are always benefited through holiday distribution, I see no reason to expect anything except satisfactory volume of trade over the ensuing six months.

The fundamentals that always go to make prosperity are certainly in evidence now, namely—an ample supply of money at reasonable rates, large individual consumption, low prices on commodities and low inventories—and my opinion is that inventories generally at the close of 1926, in comparison with the daily consumption of the country, will be on a lower basis than has been the case for a number of years. I do feel, however, that 1927 will be one of great competi-

tion in business because our productive capacity is very large, and only those concerns will prosper who are able to carry along efficiently and with sound business judgment.

While individual requirements are large, yet buyers are quite discriminating, and a tendency toward higher prices will bring a reaction in the way of smaller volume. Therefore, to continue the prosperity that we have enjoyed for the past several years, efficiency both individual and collective must be the slogan of business.

I think our people generally are contented. There is certainly comparatively little labor disturbances and I believe there has been a very decided decline in radicalism over the last twelve months which also encourages a belief in continued prosperity.

By H. B. McCORMAC

President, Virginia Manufacturers' Association, Virginia Woolen Company, Winchester, Va.

As we approach the end of the present year and begin our plans for the future, we are more interested in its prospects.

Notwithstanding the decline in price of a great many important farm products, we believe the large increase in yield per acre will afford sufficient income to prevent the grower from taking heavy losses. The present crops will bring one of the largest annual sums of new wealth into being that has been produced in several years. This will maintain the buying power which is reflected in mail order sales and reports from wholesale houses.

Industry in our section has experienced a satisfactory year, but one of considerable variation. Operating activities during the last half are considerably in excess of those of the first six months. In all lines of industrial operations, Virginia is satisfied with the year's results. There have been good and bad periods in all lines and no particular line has suffered more than another. Prices of industrial stocks are well maintained. Dividend distributions are meeting all reasonable expectations and there is little or no unemployment.

Freedom from political change will undoubtedly be a considerable factor in industrial activity during 1927. If the present Congress passes the appropriation bills and adjourns until December, 1927, we see no reason why business should hesitate upon the threshold of another year.

By E. E. STRAUS

President, Courier-Journal Job Printing Co., and director National Association of Manufacturers.

I am inclined to think that Mr. Hoover is correct in his optimism regarding the prospects for the American people for the next year. If we base our opinion

of the prosperity of 1927 on economic definitions, everybody should have plenty. The wealth of the nation is measured in food, clothing, housing, and man power. With bumper crops of cotton, wheat, and corn, general food supplies and clothing should be within the reach of all and none should go hungry or cold.

The South is bewailing the low price of cotton, forgetting to consider that they have about 30 per cent. more cotton than they usually have, and that the income from eighteen and one-half million bales at twelve and one-half cents is not so far from that produced by fourteen and one-half million bales at twenty cents as to be ruinous to the section concerned.

The Southern railroads receive just as much tariff from hauling twelve and one-half cent cotton as from twenty cent cotton making their contribution to the distribution of earnings just as great as before.

We expect to see 1927 produce an average amount of business with an average amount of profit. Commodity prices seem to be seeking a lower level and great profits are never made on a falling market, but if in the process, values are better stabilized, the resultant effect will be a more healthy economic condition. We may not declare tremendous dividends, but we will have plenty of food, clothing, warmth, and general conditions of happiness.

By E. B. LEIGH

President, Chicago Railway Equipment Co., Chicago, and director National Association of Manufacturers.

While the business outlook for 1927 is any man's guess, there seems to be a rather general hope, if not an opinion, that it will continue to be a favorable one; at least during the early part of 1927, if not throughout the year.

For many years prior to the Great War, the Iron and Steel industry was accepted as the most reliable index of general business conditions; while Railroad buying, taking in normal years the largest single percentage of the product, became a recognized barometer of general business as a whole. This relationship, however, was seriously distorted by the tremendous war demands for steel and iron. Within the last two years the inflated buying of iron and steel to meet the accumulated demands of the building industry and the ever-growing demands of the rapidly expanding automotive industry, have taken up the slack in iron and steel formerly flowing to the Railroads and to industries supplying them with equipment of various kinds, and with the heretofore unusual condition of general business prosperity, but with very restricted Railroad buying.

Looking forward, with building now thought to be on the eve of a decline, and with a less certain demand upon the part of the automotive industry; it would

seem that the answer as to future good business, or otherwise, may be found in the shifting relationship of these three economically basic industries. Within the past two years especially, the slack in Railroad buying has been absorbed by these two industries; and as to 1927, I would say, watch the trend of Railroad equipment buying, particularly in the event of any material slump in building construction or in automotive production—and there, I believe, the answer will be found.

By JOSEPH C. KIMBALL
President, Associated Industries of
Massachusetts, Boston.

As 1926 is completing her duties for the year, revealing, as a whole, quite a satisfactory record and at the same time, generating considerable hope for the coming year, it is becoming something of a past-time to record a guess as to the immediate future, then, watch the guess unfold during the ensuing twelve months.

For New England in particular there seems enough of incompleting undertakings to make an excellent beginning in 1927. More people have more money than ever before, more people will have more wants than ever before, and more of these wants will be satisfied.

Lower cotton, stabilized rubber prices, regenerated railroads, a strengthened shoe business, several new but large enter-

prises, a general awakening of her captains of industry show a large asset balance.

The able financial control of the U. S. Treasury, with its healthy influence permeating the entire country, is continually recording astonishing benefits to all phases of our business life and is the outstanding indication of the great strength of the immediate future.

The optimists seem to have the clearer path in 1927.

By FRANK R. VALENTINE
President, M. D. Valentine & Bro. Co.,
Woodbridge, N. J., and director Na-
tional Association of Manufacturers.

The condition of the fire-brick industry is measured very much by the condition of the iron and steel business. Reports of the latter indicate an unusually fine outlook for next year; some of the companies saying they expect to reach their peak and others giving varying opinions on the degree of increased business; but all, so far as I can learn, are looking for a continuation of the excellent situation that prevailed the past year.

On this basis alone, I should say the prospects for the firebrick and kindred refractories is excellent. Certainly we have every reason to be expectant of as great a volume of business for 1927 as we had in 1926.

By HENRY ABBOTT

President, Calculgraph Company,
New York.

We take pleasure in confirming the statement of Mr. Herbert Hoover that the year 1926 has been one of unprecedented prosperity. At least his statement as applied to our own industry is correct.

In the field of our experience and observation, increases in material and labor costs which narrowed profit margin has been met by a stimulated effort to develop new and better tools and manufacturing methods, resulting in the restoration of normal profit. At the same time the consuming public have benefitted in getting for the same money a better product.

If our people generally, will continue to talk, write and act optimistically, we know of no reason why the prosperity of 1926 should not continue through 1927.

If our farmer friends will read up on Luther Burbank and once a year adopt one of the thousands of things he showed them how to do, instead of hollering for help from Congress, they will be following in the footsteps of our successful manufacturers; we shall then soon lose our "agricultural problems," we shall have less socialistic legislation and our prosperity will be universal.

A LASTING TRIBUTE TO THE BUILDER'S JUDGMENT

Year after year a Masterbuilt concrete floor withstands the abuse of the hardest service—a lasting tribute to the builder who installed it.

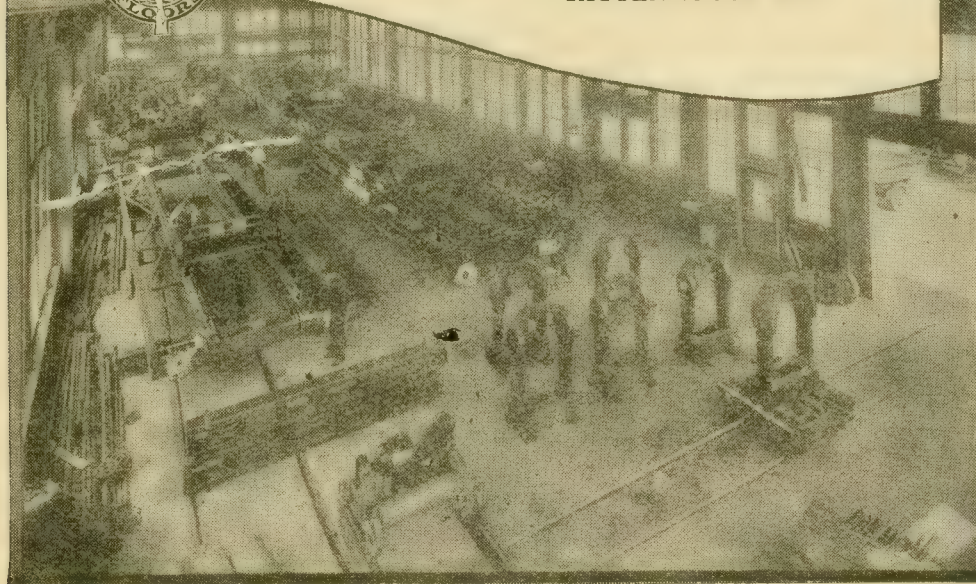

Masterbuilt concrete floors for heavy industrial use are made Wearproof, Waterproof, and Dust-proof by the use of Master Builders Metallic Concrete Hardener.

"Don't let freezing weather stop your concrete work—use 'ANTI-HYDRO' and keep right on!"

"ANTI-HYDRO" lowers the freezing point of concrete to 15 degrees F. so that work can continue even though the thermometer goes way down. At the same time, "ANTI-HYDRO" permanently hardens and waterproofs concrete mixtures in one operation. Being a liquid integral compound, it mixes easily with the gauging water without the aid of skilled labor.

The concrete work on this building continued right on through the freezing weather. Much valuable time was saved and results were entirely satisfactory.

For 22 years "ANTI-HYDRO" has been used on every type of concrete hardening and waterproofing work. Use it also for cold weather work. It will save you time and money. Write for specifications.

As The Editor Sees It

THE estimated cost of all buildings, alterations, repairs and miscellaneous work for which permits were issued by the Philadelphia Bureau of Building Inspection in 1926 was \$140,267,200, according to detailed reports printed on other pages of this issue of the GUIDE, a decrease of \$30,646,330 from the record year of 1925, which was the highest ever, \$170,913,530.

Dwelling construction showed a tremendous decline in 1926 from the 1925 record—12,954 houses of all types costing \$70,207,465—to only 8,720 costing \$41,885,775 in 1926—a loss in number of dwellings of 4,234, and a loss in value of \$28,321,690. The same number of tenement houses was begun in 1926 as in 1925, ninety-five, but the cost of the 1926 tenement houses was only \$11,876,000, compared to a cost of \$15,552,000 in 1925. The only class of buildings that showed a marked increase in 1926 over 1925 was the office buildings, forty-eight of which in 1925 cost \$11,073,100, and fifty-six of which in 1926 cost \$21,087,025. The permit for the Fidelity-Philadelphia Trust Co. thirty-story office building to cost \$10,000,000 was issued in December and that one permit in-

creases the value of office buildings almost the entire difference.

The heaviest decline following dwelling construction was in stores, a decline not in number but in value,—in 1925 \$20,016,685 was expended for 102 stores, in 1926 only \$3,189,920 was spent for 128 stores, 26 more buildings than in the same class in the year 1925. This classification showed a loss of \$16,826,765.

Garages for the first time in years showed a notable decrease—680 less in 1926 than in 1925 at a loss of \$2,941,725. 1925 had started 2,381 garages costing \$8,191,025,—only 1701 costing \$5,249,300 were built in 1926.

A decline in the cost of schools amounted to \$1,215,215, a drop in number of only one—18 schools in 1925 cost \$9,938,070; 17 schools in 1926 cost \$8,723,865.

A striking increase occurred in the number and value of the churches started in 1926 compared to 1925—24 Churches valued at \$2,634,500 were begun in 1926 and only 11 churches valued at \$915,150 started in 1925. This confirms the impression of many that Philadelphia is growing more religious.

Manufactories, too, showed an increase

from seventy costing \$3,962,720 in 1925 to eighty-four costing \$8,585,150 in 1926. Likewise the increase in Sesqui-Centennial buildings was a boost for the 1926 total cost—two buildings costing \$1,640,200 were started in 1925 and 247 buildings costing \$4,541,455 were built in 1926. A total of \$6,181,655 was the cost of the Sesqui-Centennial buildings according to the record of permits issued for buildings at the exposition.

December was the largest month in 1926 in point of value of work for which permits were granted,—\$20,846,925 was authorized in this month. This is unusual, but characteristic throughout the country in 1926—a boom for winter building. The greatest number of operations was started however in March, 2,524, according to permits. March in 1925 had the largest amount of operations started although in value July in 1925 had the largest volume of work with \$30,717,760. The one big item in July, 1925, was the \$18,000,000 Gimbel store.

Estimated cost for each month, 1926:

Month	Permits	Operations	Estimated Cost
Jan.	684	1208	\$ 7,590,755
Feb.	647	1081	9,108,245
Mar.	1230	2524	15,065,885

1919	14,509	65,088,750
1920	12,512	55,305,400
1921	14,654	42,790,780
1922	22,588	114,881,040
1923	21,546	122,650,935
1924	24,234	141,737,460
1925	25,307	170,913,530
1926	19,780	140,267,200

The decline in the number of garages
in 1926 is the first since 1918 as shown
by the following record for the last
twelve years.

Year	No. of Garages	Cost
1915	595	\$ 723,260
1916	878	1,307,340
1917	833	1,296,310
1918	480	833,320
1919	1,322	2,726,540
1920	1,153	2,502,290
1921	1,569	3,505,695
1922	1,909	5,072,765
1923	2,522	5,415,885
1924	2,778	6,951,430
1925	2,381	8,191,025
1926	1,701	5,249,300

The Thirty-fifth Ward with 2286
dwellings erected in 1926 led all districts.
The Forty-second Ward with 1960 resid-
ences and the Fortieth Ward with 992
residences followed. All of these wards,
as well as all the other leading wards in
1925 showed marked decline in 1926.
The greatest ward in point of new houses
in 1925 was the 42nd with 2964 dwellings
started.

There is a considerable volume of build-
ing in prospect for 1926 at least for the
first half year. Last year at this time

we prophesied that 1926 would not equal
the marvelous record of 1925 in Phila-
delphia and we are prone to venture that
1927 will not equal 1925 but should from
present indications equal 1926.

PREDICTIONS ON BUILDING

There are many and varied prophecies
and predictions as to the outlook and
probable progress of building operations
during 1927. After wading through them
it is not easy to come to a definite con-
clusion, but it leaves a feeling that unless
something unforeseen happens to inter-
fere it should be a good year and to quite
an extent the manufacturers of material
and dealers can help make it a good year.
Some predict that it will be a boom year,
probably the biggest year or record, not
so much because of the urgent need for
buildings as because of the feeling that
it is a good year to push business ag-
gressively while the prosperity wagon is
moving in good shape and be fortified
against any slump that may come after
the year is over. We had predictions a
year and two years ago that the building
shortage had been caught up with and
that consequently there would not be the
same urgent call for building. Yet in
the face of this we had enough building
booms in some sections of the country
to make each of the years since 1924 a
bigger and better year, and each year
there are opened bigger and better pros-
pects for future building and so it is to-
day. Conditions are favorable for a big
year in building operations. They are
not equally favorable in all sections of
the country, for in some cities there is
evidence of some surplus of housing al-
ready, but there are other sections where
expansion is going on and all told it looks
now as if 1927 may be as good if not a
better year than 1926 in building opera-
tions.—*Clay Worker.*

U. S. DEPARTMENT OF COM- MERCE RECOGNIZES "WATER-CEMENT RATIO"

The building code committee of the U.
S. Department of Commerce recognizes
the "Water-Cement Ratio" as means of
mixing concrete of a specified strength
in a series of suggestions it makes in its
booklet, "Recommended Requirements
for Working Stresses in Building Mate-
rials." The "Water-Cement Ratio" is
the law governing the strength of con-
crete. It states that the strength of con-
crete is in inverse proportion to the

amount of water used in mixing provided that the mix is workable and that the materials used are clean and sound. Many engineers and builders had believed this was the factor governing the strength of cement and it was proved to be such by Duff A. Abrams, director of the Portland Cement Association Laboratory, who established the law after a long series of tests.

In the government booklet a series of tables are given in which the strength

of concrete is shown to be directly dependent upon the quantity of mixing water used. Several aggregate proportions are given but in each case the resulting strength bears a definite relation to the volume of mixing water.

A suggestion, similar to that issued by the Department of Commerce, has been made in a proposed building code prepared by the Pacific Coast Building Officials Conference.

THE BETTER BUILDING EFFORT

Two recent incidents point to some earnest effort to awaken a keener and country wide interest in better building. One is the designing and building of what is termed a test house by R. S. Tilden, engineer, and John T. Briggs, architect, in the suburbs of New York City at the request of directors of the eastern district of the Common Brick Association. The purpose here is to demonstrate that it is practical to build a good substantial house at reasonable cost, that will be dependable and will call for only a minimum of upkeep. This is to be a brick house, in which through the use of common brick it is hoped to hold down the cost of construction, and through the use of proper materials and construction all the way through to make it a good

dependable house.

Meantime there come reports that the Southern Pine Association is having erected a modern hurricane proof home in the Lakeview section of New Orleans out of yellow pine lumber to demonstrate that good homes can be built of lumber, and that when properly built they will stand up in storms.

Several things have contributed to awaken a keener interest in better building, among them earthquakes, hurricanes and too much cheap flimsy construction that has not only opened the way to more damage from hurricanes and earthquakes, but has also shaken some of the faith of builders in the integrity of material men and craftsmen. This furnishes both a need and an opportunity to put forth the subject of better building more efficiently than it would be practical otherwise. It is an opportunity too that we should make the most of and that eventually will result in the use of more brick and hollow tile in building operations. There is no doubt that good construction can be had with other and different materials. We might as well recognize and accept this fact in the outset and not make the mistake of contending that the only real and good house is that built of brick or hollow tile. Mistakes of this kind have been. The main trouble in all the reviews of

earthquakes and hurricane damages is there has been too much partisanship and too much pleading of one material to the exclusion of others, with the result that the showings are not fair and the public instead of being convinced is confused. It gives rise to suspicion and doubts of all propaganda of this kind put out.

It is practical to improve frame construction, it is practical to improve construction made of a combination of brick and hollow tile walls and frame interiors. It is practical to improve construction made of combinations of clay products and concrete and steel. In fact there is always room to improve regardless of the kinds of material used. Also there is always room to use a number of different kinds of material in the construction of a building. Moreover there is a call for us to show due regard for the building public while promoting the interest of our own material if we are to influence and convince the public in this matter of better building. So let us join earnestly and conscientiously in this drive for better building for a study and practice of better building, and the seeking for more permanent and desirable building material will naturally lead to a wider use of clay products in building operations and to profit and the well being of the clay products industry.—*The Clay Worker.*

No More Ashes To Lug

No clumsy pan to spill dust
and dirt on the kitchen floor

The Glenwood Ash Chute

solves the problem. It is located just
beneath the grate and connected by a
sheet iron pipe straight down through
the kitchen floor to ash barrel in cel-
lar. No part is in sight. Not a par-
ticle of dust can escape. Just slide
the damper once each day and drop
the ashes directly into the ash barrel.

The Dust-Tight Cover

to barrel is another entirely new
Glenwood Idea and is very ingenious.
This is only one of the splendid im-
provements of the new plain

Cabinet Glenwood

the Range without ornamentation or fancy
nickel. "The Mission Style" Glenwood. Every
essential refined and improved upon. This
Range can be had with the latest and most
improved Elevated or End Gas Range attach-
ments. It can be furnished with fire box at
either right or left of oven as ordered. Our
handsome booklet tells all about it.

The Cabinet Glenwood

*"The Oldest
American
Fire and Marine
Insurance
Company"*

Service

When you go to a North America agent for insurance, all you pay are the premiums. His service costs you nothing. It includes complete information on the various forms of insurance protection, practical advice on the best policies for your purposes, and inspection of your property and business risks as often as you wish it.

Consult your agent as you would your lawyer or doctor.

Insurance Company of North America

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 22 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

As The Editor Sees It

ANOTHER BIG BUILDING YEAR AHEAD

Annual Forecast of the Architectural Forum Indicates Prosperous Year for the Building Industry

BY C. STANLEY TAYLOR

The closing figures of the year 1926 show an astounding total national expenditure of well over \$6,000,000,000 in new building construction. Including alterations and unrecorded transactions, this total probably measures over \$7,000,000,000, thus establishing for the past year an unprecedented record of construction activity and one which probably will be unequalled for many years to come.

When the figures were tabulated for 1925, it was felt that that year had probably established a total which might never be equalled, and while the conservative forecasts for 1926 promised another six billion dollar building year, it was not conceived by anyone that this figure would be as greatly exceeded as it has been.

Similarly, it is difficult to conceive that the year 1927 will record as great a national building investment as that of 1926. All indications point to the fact that while 1927 will probably prove to be one of the great years of building history, its total investment in new building construc-

tion will be approximately 12 per cent. less than in 1926. In other words, the forecast of The Architectural Forum, based on an extensive survey as explained in following paragraphs, indicates for 1927 a total of about six billion dollars as opposed to the seven billion dollar record of 1926.

For several years past, the Architectural Forum has carried out a comprehensive survey among architects, obtaining over 2,000 confidential reports of work actually on the boards or seriously contemplated to reach the contract stage the following year. Having these actual figures in hand, it has been found possible to apply a series of ratios which have resulted each year in a fairly close approximation of actual figures ultimately recorded. Primarily, of course, this forecast deals with work carried out through architect's offices but with the exception of small residential work (houses under 10,000) and factory buildings, the bulk of the building of this country is controlled by architects. To

the figure established by new work must, of course, be added an estimate covering remodeling and alterations. This is presented in more detail in later paragraphs.

For those who wish to review and compare building activity since 1915, there is shown herewith a classification chart recording monthly totals of plans filed, contracts let and the volume of new building as measured in cubic footage. These figures are primarily based on reports of the F. W. Dodge Corporation. There is shown also an index of building cost which offers an interesting comparison with the activity during any period of the past.

In order that some detailed measure may be had of anticipated building activity during the year 1927, the architects' report received by The Architectural Forum have been correlated and weighted for presentation in the accompanying table which shows the expected activity in 19 types of buildings, allocated to six divisions of the country. This

tabulation shows a total of \$4,856,817,500, which it is believed represents the approximate value of the new construction which will be planned and executed in 1927 through architects. In addition to this, there will be several hundred million dollars expended for small residences in rural districts, which do not come within the architect's scope of service, together with a large volume of industrial building and a considerable program of remodeling, a part of which is handled by the architect, but which is not recorded in this table. In total, therefore, the forecast for 1927 exceeds six billion dollars.

It is quite probable that a considerable part of the decrease in building activity in 1927 as compared to 1926 will be found in the cutting down of cheap speculative building. From important mortgage money sources it is learned that the constantly growing tendency is to discourage flimsy construction, and the supervision of specifications has been developed to a considerable degree of efficiency as compared to the poor methods of control exercised in past years.

Of course, one of the principal reasons for the great volume of building activity during 1926, and as anticipated for 1927, is the desire of the public for better housing of all kinds and for a more modern and attractive environment in which to carry on commercial and institutional functions. We must also take into consideration the rapid establishment of new residential districts (due to transportation improvements) and the growing habit of developing new business centers in the larger cities—areas where certain trades are becoming concentrated. This tendency is noteworthy not only in New York but in practically all of the larger cities in the country.

Coupled with these greatly increased standards of social and commercial housing conditions, there is the significant fact that the continued period of prosperity has placed the public in a position to pay for what it wants in the way of new buildings.

In spite of occasional comments, there appears at present no great danger of overbuilding, because, after all the building demand of this country is not primarily for space alone, but for space of a satisfactory quality. Here then we find conditions which are certainly discouraging from the viewpoint of owners of old buildings, particularly those which physically or because of local conditions are approaching the state of obsolescence.

The competition of new buildings will naturally be too great to sustain values in old structures, but it is probable that the new buildings themselves will not suffer materially except in isolated instances of a temporary satiation. In certain districts of New York, it may be said that 1926 has seen an overbuilt condition in certain types of buildings, such for instance as in the so-called "garment center" and in the office building situation in the Grand Central zone. While space competition is definitely in view in these districts, it is probable that this condition is, after all, only one of a year or two and that all of this modern manufacturing and commercial space will be readily absorbed by developing industrial and commercial needs for space.

One of the most interesting phases of any building forecast is to be found in attempting to measure the change in public demand for new buildings, both as to building types and geographical divisions of the country. The figures of The Architectural Forum's forecast have been carefully analyzed from this viewpoint in order that a comparison may be made with the public demand for various types of buildings as expressed in January of 1926. The following tabulation shows in detail the change in demand in 19 building types and six divisions of the country, as well as the national total.

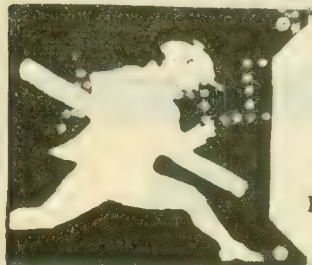

A Comparison of Public Demand for New Buildings as Shown in 1926 and 1927.

The figures given below apply to projects as reported by architects and represent the percentage of the valuation of each building type as compared with the total value of projects for the district.

UNITED STATES

Church and School, Fourth street and Grant avenue, Wilmington, Del. Architects, Gleeson, Mulronee & Burke, 404 South Broad street, Philadelphia. Owners, St. Thomas' Roman Catholic Church, Rev. Lynch, Wilmington, Del. Stone, granite, cut stone, steel, 1 story gallery and basement, 135x76 feet (plumbing, heating, electric reserved), slate and slag roof, maple floors, hollow tile, metal lath, tile and marble work, metal window guards, metal weather strip, shoring, waterproofing, bond, cast stone, floor hardener, ornamental iron work, limestone, linoleum area gratings, imitation stone. Contract awarded J. E. Healy, & Son, 707 Tatnall St., Wil., Del., \$158,000.

Store, 6 and 8 West Fourth street, Wilmington, Del., \$31,500. Architect, private plans. Owners, Fourth Street Improvement Co., on premises. Brick, steel, 2 stories, 39x100 feet, slag roof, maple floors, steam heat, electric light, plate glass, copper work. Contract awarded to J. H. Hutchinson, Newark, Del.

Apartment (alts. and add.), 210 West Seventeenth street, Wilmington, Del., \$2,575. Architect, private plans. Owner, D. L. Gabke, 210 West Seventeenth street, Wilmington, Del. Brick, 2 stories add., general interior alterations. Contract awarded to M. W. Boyce, 310 North Broome street, Wilmington, Del.

The next point of interest is to study the indications of this forecast in relation to building activity in various sections of the country in 1927 as compared to that of 1926. Reports received by The Architectural Forum have been carefully compared with last year's forecast figures and with the actual record of contracts let. This comparison shows that in the Northeastern States building activity will be approximately 10 per cent. less in 1927 than in 1926. This is closely in accordance with the average reduction of new construction volume expected throughout the country. In the North Atlantic States, which include the New York area, a similar average reduction in activity is expected. In the Southeastern States, it is anticipated that construction will be probably 20 per cent. to 25 per cent. less in 1927 than in 1926. The Southwestern States, however, promise a volume of new building approximately equal to that of last year. Figures received from the Middle Western States, including the Chicago district, show no anticipated reduction of activity—in fact, all indications point to a program probably 10 per cent. greater than that of 1926. The Western States are also to be consistent with the national reduction, showing activity about 10 per cent. less in 1927 than in 1926.

A comparison of anticipated new construction in various types of building for 1927 provides a basis for anticipating a number of changes both nationally and in various districts. The detailed comparison is found in the percentage tables presented with this article, but some of the outstanding features are as follows:

For the entire United States, new automotive buildings, bank buildings, club and fraternal buildings, community and memorial buildings, hospitals, commercial buildings, schools, stores, theatres, and welfare buildings will be constructed in approximately the same proportion to the total new construction as was the case in 1926. A considerable increase is anticipated in the building of apartment hotels, churches and public buildings. Apartment buildings will represent somewhat larger proportion of the new construction than in 1926.

The construction of new hotels promises to be probably 20 per cent. less than the actual figures of 1926. In forecasting hotel construction last year, The Architectural Forum's figure turned out to be considerably too high because it included a large number of projects which failed to materialize due to failure in financing programs. In Florida, for instance, many hotels which actually reached the foundation stage, were not completed because of the collapse of the boom. Similarly, many local "drives" failed because the project in mind was evidently too large—a point which should be carefully watched in relation to any new hotel project, and one which the hotel industry is watching carefully for 1927.

The Architectural Forum's estimate of hotel building shows a greater demand in the Northeastern States for 1927 than 1926; approximately the same in the North Atlantic States; a reduction of about 20 per cent. in the Southeastern States; approximately the same in the Southwestern States; less than half the demand in the Middle States (where a vast amount of new construction has been carried out), and approximately the same in the Western States. DETAILED FORECAST of NEW BUILDING CONSTRUCTION for 1927

(These figures represent only work being planned by architects)

*Architects plan only 20% of small houses—multiply figures by 5 for grand total. †Architects plan 50%

©THE ARCHITECTURAL FORUM

BUILDING ACTIVITY in the UNITED STATES SINCE 1915

demand for new hotel buildings in the United States for 1927 is probably one-third less than that indicated for 1926.

A reduction of approximately 15 per cent. is expected in new construction contracts let for industrial buildings, such as factories and warehouses. Dwellings under \$10,000, which made up approximately one billion dollars of last year's total, will probably show a 20 per cent. reduction in activity, while the construction of dwellings over \$10,000 will be about 10 per cent. less.

The above deductions, as taken from the large number of individual reports received by The Architectural Forum in its Annual Survey, seem to be quite in accordance with changing trends of public demand for new buildings. The increased activity in apartment hotel building, for instance, is a definite reflection of a change in the mode of living which seeks convenience and comfort without the responsibilities of operating large individual dwellings. Thus, it is anticipated that there will be a definite increase in the number of co-operative apartment buildings, and no decrease in the volume of high class apartment construction.

To sum up the general impressions of this forecast, it is apparent that 1927 will be another year of considerable prosperity for the building industry and that economic conditions will provide both the demand and the means to add to the vast contribution to the nation's total of well built structures. The labor situation in the building trades promises to remain approximately the same, without any great element of change or disturbance. The program of building finance is operating smoothly and in readiness to take care of all sound projects—with an eye to discourage new building projects which show an economic weakness either from the viewpoint of demand or because of poor specifications.

In other words, the United States is apparently going about its building business in a sensible way, meeting requirements in a far seeing manner, and undertaking no program which will do other than meet the sane requirements of the situation. Over the next few years a gradual reduction of building activity is anticipated—one which will ultimately bring the national building program to a new normal of approximately \$4,000,000,000 a year.

MORTAR

Its Importance to the Mason and Builder
(Continued from a previous issue)

Cost of Mortar

The cost of any mortar is, of course, the material cost of the ingredients and the labor cost of preparing and mixing.

If the necessary amount of each ingredient and its price in the local market are known, the cost of materials is found

by a very simple calculation—multiplying the amount by the unit price.

A laborer with some experience should be able to slake, sand and stack about $1\frac{3}{8}$ barrels of lime per hour or 11 barrels in an eight hour day. The time required for mixing and tempering mortar per 1000 bricks is from one to one and one-half hours, depending on the thickness of the mortar joints, for both lime and cement mortar.

One mortar maker, working by hand, should supply five bricklayers; with a mixing machine, one man can supply 25 or more bricklayers. Assistance in bringing materials to the machine is necessary. It is economical, in any sizable job, to use expert mortar mixers and so keep bricklayers amply supplied with good mortar, as well as with bricks.

The following information should enable one to ascertain the approximate amounts of brick, mortar and labor time for 100 square feet of wall surface of three standard wall thicknesses of the more common types of construction. All quantities are based on the standard brick size of $2\frac{1}{4}$ inches x $3\frac{3}{4}$ inches x 8 inches.

Useful Information

Cement: A bag of Portland cement contains 94 lbs. net.

A barrel of Portland cement contains four bags or 376 lbs. net.

When packed, Portland cement weighs about $108\frac{1}{2}$ lbs. per cubic foot; when loose, 92 lbs. per cubic foot.

Portland cement should be kept from dampness.

Keep empty bags dry, for allowance is made for bags returned in good condition.

A cubic foot of cement paste requires about 94 lbs. of cement.

Lime: A bushel of lump lime contains from 75 to 85 lbs. net.

A cubic foot weighs from 60 to 65 lbs. A 180-lb. barrel contains about 3 cubic feet.

A 280-lb. barrel contains about $4\frac{3}{4}$ cubic feet.

The average amounts of lime putty obtained from lump lime is as follows: From one bushel lump lime, 3 cu. ft. putty.

From one 180-lb. barrel, 7 cu. ft. putty.

From one 280-lb. barrel, 11 cu. ft. putty.

Hydrated Lime: One cu. ft. weighs about 40 lbs.

One paper package contains about 50 lbs. net.

One cloth package contains about 100 lbs. net.

One 100-lb. package makes about 2.28 cu. ft. of lime paste.

Sand: A cu. ft. weighs about 100 lbs.

Is usually sold by the yard (cubic yard) which contains 27 cu. ft.; sometimes by the ton (2000 lbs.) which contains about 20 cu. ft.

Brick: The standard size of building brick is $2\frac{1}{4}$ in. x $3\frac{3}{4}$ in. x 8 in., but slight variations in these dimensions are unavoidable and permissible.

The average brick weighs about $4\frac{1}{2}$ lbs.

One thousand (1000) brick closely stacked occupy about 56 cu. ft. of space.

Brick necessary for 100 Square Feet of Wall Surface

The approximate amounts of standard-size brick necessary to build 100 square feet of wall of the three standard thicknesses are given below. From these data may be *estimated* the amount and cost of mortar for any specific piece of work. For more complete and detailed data, the reader is referred to our book "BRICK—HOW TO BUILD AND ESTIMATE."

Materials Required for Making Mortar

The quantities of each material given are the approximate amounts necessary to make 100 cubic feet of mortar of the recommended mixes. The amounts for any quantity other than 100 cu. ft. can be readily calculated by multiplying the quantities given herewith by the desired number of cubic feet and dividing the quotient by 100 (or by pointing off two decimal places from the right, which is the same thing.)

Lime Mortar: (1 part lime and 3 parts sand) will require about:

5—180-lb. barrels of lump lime, or
29—50-lb. sacks of hydrated lime and
4—cu. yds. of sand.

Cement-Lime Mortar: (1 part cement, 1 part lime and 6 parts sand) will require about:

13—94 lb. sacks of cement,
2—180-lb. barrels lump lime, or
15—50-lb. sacks hydrated lime and
4—cu. yds. of sand.

Cement Mortar: (1 part cement and 3 parts sand, with 1-10 of the cement, by weight, replaced by dry hydrated lime or its equivalent in lime putty), will require about:

33—94-lb. sacks of cement,
1.2—180-lb. barrels of lump lime, or
7—50-lb. sacks of hydrated lime, and
4—cu. yds. of sand.

Cement Mortar: (1 part cement and 3 parts sand) will require about:

37—94-lb. sacks of cement, and
4—cu. yds. of sand.

ENGINEERS REDUCE WEATHER MAKING TO EXACT SCIENCE

Take Tip From Mark Twain and Change Climatic Conditions—Dominates Air Control

By E. B. CRESAP, *Ventilation Expert.*

It may seem a far cry back to the days when Mark Twain used to "razz" the

weather of New England and his famous line that "Everybody always has complained about the weather, but apparently no one has ever done anything about improving it."

But during those intervening years science and engineering skill have made rapid strides and one of the mechanical wonders of this age of wonders is the mechanical control of air, or scientific ventilation.

The fact of the matter is that the ventilating engineer of today can create any condition of weather or climate wanted. He plays with air like the par golfer or star pitcher plays his ball. He controls air—directs it—curves it—dominates it. Mechanical ventilation, electrical air control, manufactured weather or what you please, has been reduced to an exact science.

Do you want your home, school, theatre, factory or office torrid, frigid, arid, humid or like an ideal, balmy day in exquisite June—58 degrees wet bulb temperature? If so, the ventilating engineer can fill the prescription in every detail.

Until just two or three years ago, theatres and other public gathering places closed every summer because of the hot weather and resultant low attendance. What is happening now? Electrical air control carries off the heat and cools the theatre. People go to many theatres on the hottest days in summer to keep cool! Thus, the theatres are turning a serious liability into a solid asset.

One of the unhealthiest places in the world used to be the "little red school house up on the hill." Here children were packed into stuffy, odorous rooms, with absolutely no ventilation except the occasional spasmodic opening of a rattling window that was quickly closed when cold draughts brought chills and shivers. Thousands of children caught bronchitis, tonsillitis and all the other itis's and isms because of a stupid system that vitiated their little bodies with dead, fouled air and annihilated their resistance to disease.

What is happening now? Many cities and states have passed severe laws compelling mechanical ventilation of schools. An aroused public sentiment has become crystallized against the wicked, crass attitude that our children are not worth spending a few extra thousand dollars on in the protection of their lives and health.

Public schools in Detroit, St. Louis, Chicago, Columbus, Bloomington and scores of other American cities are now equipped with immense air washing machines and all the other equipment necessary to properly clean, temperature and humidify the polluted air of our cities.

Electrical control of air or air conditioning plays a major role in almost every ramification of modern life. It is used in hotels, greenhouses, hospitals, department stores, warehouses, cold storage

plants, printing establishments. Without it, mass production in industry, as we know it today, would be impossible. Air conditioning is vital in the manufacture of candy on a large scale. It is imperative in the volume production of bread, corn flakes, yeast, rubber, chewing gum, textiles, drying tea, gunpowder, photo-gravures and a hundred other things too numerous to mention.

Huge blower type fans are used in the very bowels of the earth to ventilate mines and minimize the danger of coal dust explosions. The ventilating engineer conditions the air in flour mills to prevent explosions. Such modern giants as the Holland tunnel under the Hudson River and the Liberty tunnel that ploughs through the small mountain that splits Pittsburgh would be impossible without mechanical ventilation. Proper ventilation by mechanical means nullifies the menace of carbon monoxide gas, the deadly poison poured out from the exhausts of millions of automobiles.

Fundamentally, the ventilating expert manipulates four factors to produce exactly any type of weather desired. They are: temperature, humidity, cleanliness of the air and effective distribution of the air or air motion. These can be controlled automatically and if variations are wanted they can be controlled or directed automatically. Like a chain that is just as strong as its weakest link, each of these factors is indispensable to health and comfort.

Is your home or building too dry or too moist? One extreme or the other is created by the relative humidity present or the amount of water-vapor mixed with the air. There are times when humidity is more important than temperature. The temperature may appear all right, but you may be decidedly uncomfortable because there is too much humidity. If the air is still, you will feel uncomfortable. Why? Because air motion carries away body heat and moisture.

How many tons of dirt and dust do you suppose the air of our American cities carries each day? How many buckets of dirt and dust do you breathe each year? In special experiments, it was revealed that one public school in Brooklyn removed one bucket or five pounds of dirt every school day from the air entering the building. This dirt was taken each day from the residue left in an air washer.

Construction costs declined slightly during 1926, reaching the lowest average occupied in any year since 1922, according to statistics compiled by the Associated General Contractors of America and announced today. The tendency toward lower cost levels, in force since mid-summer of 1923, continued to make itself evident.

The year was conspicuous for slight fluctuation in the cost of construction, virtually a single level being held throughout the last five months of the year. Earlier, the cost figures had consistently refused to approach the higher levels of 1925.

The average of costs for 1926 was slightly less than twice as great as the 1913 average, holding the 197 level on an index which takes the pre-war year's average as its basis. The 1925 average was 199, while the 1924 figure was 202.

The lowest mark reached during 1926 was noted in October, and the highest level was assumed in May, the respective index figures being 195 and 199. The December figure was 196.

The decline in the average cost of operations last year was largely the result of decreases in the prices paid by general contractors for basic materials entering into their operations. The average of these prices paid during 1926 showed a drop of five points from the index figure of 183 established in 1925.

The average of wages paid by contractors in the principal construction centers of the United States during 1926 was slightly more than the corresponding average registered for 1925. The 1926 average occupied the 225 level, one point above the plane held by the 1925 average.

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

All advertising pays—even that which is poorly constructed. A bad ad. is better than no ad. at all. It is worth all that it costs in the competitive world of the present day, merely to keep one's name where the possible buyer cannot help seeing it. To be out of sight in the commercial world is to be out of mind.

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us; we choose them for ourselves.—H. W. Mabie.

We'll write your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

write practically every form of Insurance, except life*

"ANTI-HYDRO" Lowers the Freezing Point of Concrete to 15° F.

You don't have to stop your Concrete and masonry work during freezing weather if you use "ANTI-HYDRO." All the brick work in this building was laid during freezing weather; results were entirely satisfactory.

"ANTI-HYDRO" is a liquid integral compound which also makes concrete permanently hard and waterproof all in one operation. It is easy and economical to use—simply mix it with the gauging water—no skilled labor required.

During the 22 years that "ANTI-HYDRO" has been in use, it has never failed to produce satisfactory results. Use it on your next job.

WRITING A NEW BUILDING CODE

*How New Orleans Handled the Problem
With Aid of Engineering Societies—
Pile Foundation and Wind
Pressure Provisions*

By F. A. MUTH

*First Assistant Superintendent, U. S.
Lighthouse Service, New Orleans, La.*

New Orleans has a new building code. It replaces the former code of 1910 and is not a revised or amended document but a wholly new document. The story of how it was brought into being is of interest not only because of the method followed but also because of the fact that it is based on principles of modern practice and is so arranged as to be readily amended.

The Louisiana Engineering Society for several years has been advocating a new building code for the city, and in the spring of 1924, with the aid of the Contractors and Dealers Exchange, an appropriation by the city was secured for the employment of some one to codify the building laws.

Organizations of business and professional men offered their services, and representatives of these organizations were accepted by the city engineer to form an

advisory committee. This committee was headed by Col. Marcel Garsaud, general manager of the Board of Commissioners, Port of New Orleans; he represented the Association of Commerce as well as the Contractors and Dealers Exchange. Each of the other members of the committee was the chairman of a sub-committee made up of specialists in various professional lines, representing the following organizations: General Contractors Association, American Institute of Architects, Louisiana Engineering Society, Louisiana Fire Prevention Bureau, New Orleans Homestead League and Real Estate Association, and Louisiana Bar Association. These sub-committees had from two to twenty members, and included a total of 58 men, all selected with a view to their ability to assist in the preparation of the code.

Upon a recommendation of the advisory committee and the city engineer, the writer was employed as technical expert after being granted leave from government service. He prepared digests of the building codes of progressive cities in all sections of the country together with a digest of the old building code, which formed the basis for drawing up a skeleton outline of the new code. After this

outline was adopted, the recommendations of the various sub-committees were received, together with suggestions from interested citizens and from numerous national organizations and government bureaus. The suggestions, when codified, were acted on by the appropriate committees, and were then printed in tentative form, which was held for suggestions and criticisms for a period of over a year. Especial benefit was derived from suggestions by both local architectural associations. The advisory committee then prepared the final draft of the code, and subsequently recommended it to the Commission Council. The latter on Oct. 19, 1926, adopted it by ordinance.

Standard Specifications Used—While committees at all times bore in mind that safety is an important element in any type of construction, great concern was given to cost and economy in the building laws. To this end building codes of other cities were considered, though not followed except when suited to the local requirements. The work of the U. S. Department of Commerce in standardization was kept in mind and it was found that the work of the building code committee of that department was most helpful. Quality requirements of masons' and

other materials were based on the specifications and tests of the American Society for Testing Materials.

In order to simplify future modernization, the following were adopted as standards in the code: for concrete construction, the recommendations of the Joint Committee on Standard Specifications for Concrete and Reinforced Concrete (1924) for steel, the specifications of the American Institute of Steel Construction (1923); for stresses in timber, the basic grading rules and working stresses for structural timbers of the U. S. Forest Service (Forest Products Circular 295, 1923). These standards were considered to represent the best present requirements and practice, but to prevent the code from becoming obsolete it is provided that subsequent issues of these standards may be adopted by publication of notice in the city's official journal.

Local Problems; Piles—Certain engineering features were considered as a local problem, and existing codes of other cities were not employed as criteria or standards. Due to the peculiar soil conditions in this locality the following paragraphs were adopted to cover the driving of piles:

No part of the load carried from the footings to the piles shall be figured on the soil surrounding the pile.

The city engineer shall be satisfied as to the sufficiency of the sustaining power of all piles. The city engineer may require test piles to be driven at the expense of the owner to determine the length and safe supporting power of piles for the structure.

Should test piles be required by the city engineer, the number of said test piles, the manner of driving same, the records of borings, etc., shall be such as to meet the approval of the city engineer.

Should the city engineer so require, the said test piles must be tested with known loads at the expense of the owner, and the method of applying the test loads and of making and recording observations on the loaded test piles shall be such as to meet the approval of the city engineer.

Certified copies of records of driving test piles, of loading same and of observation on the loaded test piles shall be furnished the city engineer.

The allowable working loads on a wooden pile or on a concrete pile shall be in no case more than one-half of the load which can be sustained for 48 hours with 0.01 in. per ton of load

applied, and no observable settlement in the succeeding 48 hours.

The city engineer shall be notified of the time when the test piles will be driven and loaded. In the absence of the city engineer or his representative the driving of test piles may proceed, provided reasonable notice has been given.

Wind Bracing—The matter of wind pressure and wind bracing requirements is covered by specifying 25 lb. per sq. ft. normal to the wind (reduced by Duchemin's formula for inclined surfaces), and 0.6 as much on cylindrical surfaces. Stresses due to wind combined with load may exceed the otherwise allowable stresses by one-third. Anchorage is required when the overturning moment exceeds half the moment of stability.

As to wall resistance the following is specified:

The resistance offered to the distortion of a framed structure by spandrel walls and partitions shall not be counted upon, but said distortion shall be provided for by properly designed bracing.

The engineering committee after careful consideration of the requirements of this locality arrived at the value of 25 lb. for the wind pressure. This, however, was based on the frame of the structures carrying the wind load without any reliance being placed on the stiffening or bracing effect of the spandrel walls or partitions. Furthermore, the enforcement of the requirements of the new code is premised upon an increased organization in the Building Department with an adequate force of structural engineers for checking plans and of more inspectors in field.

Designer Must Be Licensed—In line with the growing tendency in other parts of the country to safeguard the public, further requirements in the checking of drawings were insisted upon. The importance of the qualified architect and engineer is recognized in the following requirements for the signing of drawings to secure the building permits:

All plans involving structural design of sufficient importance, in the opinion of the city engineer, shall be signed by an engineer or an architect registered under the laws of the State of Louisiana; said engineer or architect to be qualified for structural design.

As already mentioned, Col. Marcel Garsaud was chairman of the advisory committee. Prof. Donald Derickson was

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; LAST DAYS FOR FILING BIDS; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Post Office, West Philadelphia, Pa., \$11,000,000. Architect, James A. Wetmore, Treasury Department, Washington, D. C. Owners, United States Treasury Department, Washington, D. C. Work contemplated. Recommended.

Building (alts.), 1634 Walnut street, Philadelphia. Architect, private plans. Owner, H. John Homan, Southeast Corner Eighteenth and Cherry streets, Philadelphia. Work contemplated.

Residence (alts. and add.), Southwest Corner Forty-sixth and Pine streets, Philadelphia. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owner, Louis Sabloskey, on premises. Preliminary plans in progress.

Store Building, Greene and Cheltenham avenue, Philadelphia. Architect, Clarence E. Wunder, 1520 Locust street, Philadelphia. Owner, George Allen, 1214 Chestnut street, Philadelphia. Brick, steel, limestone, stone, concrete, 3 stories. Plans in progress. Architect will take bids in two months.

Schools (2), Forty-eighth and Walnut streets; Cottman and Loretto streets, Philadelphia. Architect, I. T. Catherine, Nineteenth above Chestnut street, Philadelphia. Owners, Board of Education, Nineteenth above Chestnut street, Philadelphia. General heating, electric, plumbing, ventilating. Owners taking bids due February 1st.

Various Schools (alts. and add.), gas ranges, etc. Owners taking bids due February 1st.

Store and Apartment, 3434 North Broad street, Philadelphia. Architect, Frank V. Nickels, 15 South Twenty-first street, Philadelphia. Owners, Park Realty Co., 4104 North Fifth street, Philadelphia. Owners taking bids as soon as possible.

Store Fixtures, 1120 Chestnut street, Philadelphia. Architect, Sol. Kaplan, 10 South Eighteenth street, Philadelphia. Owners, Lincoln Shoe Co., care of architect. Architect taking bids due as soon as possible.

Residences (4), Stores and Apartments (4), Sedgwick, Idell and Cresheim road, Philadelphia. Architect, Ralph Goldberg, 1626 Chestnut street, Philadelphia. Owner, H. E. Greenberg, North American Building, Philadelphia. Brick, 2 stories, 26x30 feet, 19x50 feet each, slag and slate roof, hardwood and pine floors, cement work, garages in basement, plate glass, flush bulks, metal lath, tile work, hot water heat, electric light. Owner taking sub-bids.

Parochial School, 623-25 Christian street, Philadelphia, \$180,000. Architects, Hoffman-Henon, Inc., Finance Building, Philadelphia. Owners, St. Mary Magdalen De Pazzi Church, Rt. Rev. Monsignor A. Garritano, 710 Montrose street, Philadelphia. Brick, cut stone, steel, 4 stories and basement, 140x72 feet,

slag roof, cement and maple floors, metal weather strip, architectural terra cotta, metal lath, tile, marble and terrazzo, rolled steel sash, bond, ornamental iron, metal toilet partitions. Permit issued.

Office and Shop, Southwest Corner Second and Luzerne streets, Philadelphia, \$35,000. Architect, private plans. Owners, Connery & Co., Second and Luzerne streets, Philadelphia. Brick, 2 stories, 53x55 feet, 53x185 feet, slag roof, electric light. Permit issued.

Residences (2), 129-31 East Mermaid lane, Philadelphia, \$7,500 each. Architect, private plans. Owners, Marilina Brothers, 133 East Mermaid lane, Philadelphia. Concrete block, 3 stories, 16x38 feet 6 inches, 11x13 feet 6 inches, slag roof, hardwood and pine floors, hot water heat, electric light. Permit issued.

Bridge on line I street, under Connecting Railroad, Philadelphia. Owners, Department of Public Works, Bureau of Engineering, 215 City Hall. Low bidders: Kaufman Const. Co., Pennsylvania Building, Philadelphia; Mundy Paving Co., 226 South Warnock street, Philadelphia.

Fire Station, Foulkrod and Darrah streets, Philadelphia. Fire station, 4445-51 Main street, Manayunk, Philadelphia. City architect, John Molitor, 1315 Walnut street, Philadelphia. Owners, Department of Public Safety, City Hall, Philadelphia. Low bidders: Foulkrod and Darrah streets—McCormick-Lenham, Broad and Tasker streets, Philadelphia, \$61,000; J. B. Kelly, 2315 Walnut street, Philadelphia, \$63,936; electric, Charles W. Jester, 3038 West York street, Philadelphia, \$2,715; heating, Fred Wackenhut, 2416 Frankford avenue, Philadelphia, \$4,319; plumbing, Bullman Brothers, Fifth and Cumberland streets, Philadelphia, \$4,096. Main street—McCormick-Lenham, Broad and Tasker streets, \$59,000; J. B. Kelly, 2315 Walnut street, \$59,786; electric, Charles W. Kester, 3038 West York street, Philadelphia, \$2,013; heating, Fred Wackenhut, 2416 Frankford avenue, Philadelphia, \$4,429; plumbing, Bullman Brothers, Fifth and Cumberland streets, Philadelphia, \$4,196.

Miscellaneous Sewer Work, Philadelphia. Low bidders Owners, Department of Public Works, Bureau of Engineering, 216 City Hall. Alcott, Colgate to Bingham street, Perna Engr. & Const. Co., 739 South Eighth street, Philadelphia, \$5,678.23. Anchor street, Penn to Saul street, Garafola & Baradi, 3626 North Sixth street, Philadelphia, \$3,510. Camac, Mt. Vernon to Wallace, H. H. Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., January 21, 1927.—SEALED BIDS in duplicate will be received until 3 P. M., February 25, 1927, and then publicly opened, for furnishing all labor and materials and performing all work for the construction of the United States Post Office at Lewistown, Pa. Drawings and specifications may be obtained from the Custodian of the site at Lewistown, Pa., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 52)

chairman of the engineering committee. John Klorer, who was city engineer when work on the code was commenced, later was elected commissioner of public property, and by nature of his engineering training, was able to appreciate the engineering importance of the new building laws.—*Engineering News-Record*.

PLANNING THE NEW BUILDING

By FRANK P. CARTWRIGHT

(The appended article on "Planning the New Building" appeared in *Industrial Power*, November, 1926.)

What kind of a building should be built to house the new addition? This is the question, according to construction statistics, which several thousand industrial executives are asking themselves each year. Shall it be brick-walled, with heavy timber floors; shall it be steel-framed throughout, with floors of concrete; or shall it be of reinforced concrete entirely? The question very often is answered by the consulting engineer or architect called in to execute plans and supervise construction. Sometimes it is settled when the consultant is chosen, for many engineering and architectural firms

are known to be specialists in one or another of the major construction types.

Precedent also plays a part. Often, in spite of its greater cost or manifest disadvantages for his purpose, the executive is unconsciously reluctant to depart from the construction which characterizes his existing buildings. Certain types of buildings are customary and familiar in specific industries or in certain parts of the country. Heavy timber construction, for example, is following the textile industry from New England, where it was first developed, to the South, where vast timber resources promise generous supplies of material for many years to come. Reinforced concrete is apt to be a favorite where heavy floor loads and wide spans are necessarily combined.

The engineer consultant, in the last analysis, is best equipped to select the most suitable construction type. It is the purpose of this article, however, to discuss simply some of the considerations which should govern selection, and to assist the business executive in making sure that no important factor has been overlooked.

New Building a Problem in Economics

A new building is primarily a problem in economics. Considerations of original cost, maintenance and repair charges, useful life, salvage value, etc., must be balanced against comfort, convenience, fire resistance, etc., which in turn are expressed financially through their influence on production. There are four more or less clearly defined types of construction in use for large industrial buildings:

1. Buildings with reinforced concrete columns, floors and walls.
2. Heavy timber construction, with wooden columns, beams and floors, and masonry sidewalls.
3. Steel framed buildings with concrete floors and light masonry sidewalls.
4. Steel framed buildings with sheet steel siding.

Costs

Original costs depend on time and place, the cost and availability of raw materials and labor, and the familiarity of contractors with different types of work. For industrial buildings heavy timber construction is usually cheaper in first cost, but because of local conditions this relation may be reversed at times in favor of steel or concrete.

An investigation made in 1916 in the Chicago district showed that for a large number of buildings the average cost of heavy timber construction ranged from 80% to 90% that of reinforced concrete. In a specific case, in which a reinforced concrete building was duplicated as nearly as possible in heavy timber construction, the latter structure cost only 76.5% as much as that of concrete. Reinforced

concrete buildings in the New England States during the period of 1910-17 cost from 5% to 15% more than heavy timber construction, and structural steel buildings from 10% to 25% more. In 1920, because of the relatively high cost of brick and timber, this differential had practically disappeared, but a recent canvas of consulting engineers in New England shows that for buildings not more than five stories in height, heavy timber construction now costs from 5% to 25% less than reinforced concrete or steel framed structures. Of these latter, in turn, reinforced concrete is reported somewhat more economical than structural steel for low buildings and the reverse is generally true for high buildings.

Comparative costs are summarized below for 20 large industrial buildings erected between 1922 and 1924 at points widely distributed over the Eastern States:

Type of Building—Masonry walls, wood columns, beams and floors; No. of Projects—8; *Average cost per sq. ft. area—\$1.45.

Type of Building—Reinforced concrete walls, columns, beams and floors; No. of Projects—6; *Average cost per sq. ft. area—\$2.09.

Type of Building—Masonry walls, steel columns and beams, wood floors; No. of Projects—2; *Average cost per sq. ft. area—\$1.77.

Type of Building—Masonry walls, cast iron columns, wood beams and floors; No. of Projects—1; *Average cost per sq. ft. area—\$1.84.

Type of Building—Masonry walls, cast iron columns, steel beams, wood floors; No. of Projects—1; *Average cost per sq. ft. area—\$1.97.

Type of Building—Masonry curtain walls, concrete columns and beams, wood floors; No. of Projects—1; *Average cost per sq. ft. area—\$1.57.

Type of Building—Masonry curtain walls, concrete columns, steel beams, wood floors; No. of Projects—1; *Average cost per sq. ft. area—\$1.95.

A detailed estimate recently prepared by a firm of consultants to discover the cost of a seven-story warehouse using different construction types showed the following results:

	Cost per sq. ft. of Floor Area
Steel frame, brick walls, laminated wood floor.....	\$2.23
Concrete frame, brick panel walls, laminated wood floor.	1.96
Steel columns, brick walls, wood beams and floor.....	2.02

*These figures are exclusive of heating, lighting, ventilating, plumbing, sprinklers, elevators, and other service equipment. They relate strictly to the structural parts of the building.

These figures include all construction costs and allowance for overhead. They do not constitute a comparison of distinct construction types, but indicate strongly that such comparisons are worth while from an economy viewpoint.

Speed of Erection

Often the new building is needed in a hurry. Under such conditions the delay necessary for concrete to cure and gain its strength or for plaster, fireproofing and other interior finish to dry out, must be avoided. In these cases, the use of heavy timber construction is indicated, since no interior finish or fireproofing is necessary, and the structure can rise as fast as men can lay brick and drive nails. The saving in carrying charges due to shortened construction periods also amounts to a considerable item.

Brick masonry which is to receive heavy loads within a short period after it is laid, should be put up with mortar having a high proportion of portland cement in it, as lime mortar sets more slowly. Where reinforced concrete is insisted upon, greater speed of construction can be secured at a somewhat increased expense by the use of a newly developed kind of hydraulic cement which gains strength more rapidly than the familiar types.

Useful Life of Building

Building for durability often receives more emphasis than it deserves. The prospective useful life of any of the construction types under discussion is much greater than the existence which can be predicted with confidence for the industry which it houses.

There are many buildings of heavy timber construction which have been in use for a century or more. Structural steel and reinforced concrete are comparatively recent developments in industrial building but there are few reasons for believing that they will not be almost as durable. If reasonable measures are taken to prevent corrosion of metal, decay of wood and disintegration of concrete, the builder may dismiss durability, as an important factor, from consideration, and devote himself to securing at least cost a construction type which offers greatest economy and serviceability.

Maintenance Costs

Exact data are not available on the relative maintenance charges for industrial buildings of different types and probably would have limited application if they could be obtained, since the expenditures for such purposes depend greatly on the occupancy, and the carefulness with which the building is kept up. Maintenance charges can be greatly reduced by attention to details and by avoiding opportunities for depreciation as far as possible.

Steel framing should be kept well

painted, especially when exposed to smoke, fumes or moisture, or where used in poorly heated buildings. Sudden temperature changes in such buildings, coupled with high relative humidity, bring about condensation of water on the metal and resultant corrosion. The design should avoid surfaces not accessible to the paint brush, and places where dirt or moisture may collect.

Both steel and timber should be carefully protected against deterioration where the ends of the members rest upon floors or masonry walls. Openings should have their bases elevated above floor level. The elimination of concealed spaces, which is the essential characteristic of heavy timber construction, helps to detect any tendency toward deterioration and to check it promptly. Plank or laminated timber floors should be free to move on the supporting beams and girders and should have room for expansion and contraction due to moisture changes.

Concrete floors should be laid very carefully to avoid disintegration or "dusting" under traffic. The finished surface should be kept damp for at least two weeks after it is laid. If it still crumbles there are a number of chemicals which help considerably to check disintegration.

Care should be used in selecting and applying paint. Paint not only protects against deterioration, but also influences greatly the efficiency of workers and the amounts spent for lighting. Both steel and wood are often insufficiently painted. Tests at Iowa State University of steel panels painted with compounds recommended by different manufacturers showed 96 panels out of 139 rusted and pitted after an exposure of only two and one-half years. Tests by the National Electric Light Association show a wide range in the reflective powers of painted interiors, with corresponding influence on the lighting efficiency of windows or artificial light sources. There are a few paints which can be washed effectively and there are many which will not stand scrubbing. The former cost a little more, but they pay big dividends in reduced maintenance.

Masonry exterior walls seldom require attention. Observations on reinforced concrete buildings in use for some years indicate that the concrete should be at least two and one-half inches thick outside of the reinforcement steel to insure against corrosion and resultant damage.

Except under extreme conditions the durability of floors is subordinate to their service aspects. Assuming competent design and care in construction, floors and mechanical equipment are ordinarily the only parts of the buildings subject to wear. Both wood and concrete, properly protected against decay and disintegration, have shown satisfactory durability under a wide range of conditions. Wood or some other resilient surfacing is very

desirable where foot traffic is heavy. Wood is less slippery when oil soaked, and less noisy than concrete. When worn out, wood floors are more easily and successfully replaced than worn concrete surfaces, and changes or repairs to plumbing, heating and other mechanical equipment are usually more convenient with wood floors.

Salvage

Due to the rapid growth of American cities and of industrial enterprises, the removal or extensive alteration of industrial buildings often becomes necessary before they are threatened with physical disintegration. The relative expense and difficulty of such removal and the possibility of salvage is, therefore, an important consideration in selecting construction types. From this viewpoint the reinforced concrete building is strongly at a disadvantage. It is not unusual for wrecking companies to ask from 15% to 50% as much for wrecking and removing a well-built, reinforced, concrete building as would be asked for its erection. Practically no salvage value attaches to the debris and its disposal involves expensive hauling. Some scrap steel usually is recoverable from steel-framed structures, but the amounts realized are insufficient to pay more than a small proportion of the wrecking cost. Heavy timber construction, if properly built, is so constructed that it can be readily taken down. In most types the heavy plank floors are not fastened to the supporting timbers and in practically all cases the steel caps and bearings, by which columns and beams are attached to each other and to the walls, are of a nature permitting quick detachment. Second-hand bricks recovered from the massive walls of such buildings are a recognized article of commerce in most large cities, and find a ready market for backing and foundations in new structures.

In fact it is often true at present and may well be true in the future that timber recovered from a building of this type will be worth more as salvage than it cost when new, and that the material having served its purpose in the building, will pay fair dividends as an investment.

Fire Resistance

The relative fire hazard involved in buildings of heavy timber, steel-framed and reinforced concrete construction is a consideration deserving careful attention of the industrial executive. Because wood will burn and certain other materials will not, there has been of late a tendency on the part of the building public to assume that structures built in whole or in part of wood are necessarily more subject to fire or are more dangerous to the occupants as fire hazards than are buildings constructed entirely of non-combustible materials. There has been, naturally, no effort on the part of those selling com-

peting materials to dispel this impression, and timber manufacturers find themselves under the necessity of presenting an analysis of the situation, which prospective builders are often competent to make but which they are apt to overlook in deference to prevailing opinion.

Fire can occur in a building, either through communication from another building or through occurrence of the fire in the building itself. Fires of the former type are comparatively rare, only one or two in a hundred being thus caused. To such fires all the major types of industrial buildings having masonry exteriors oppose substantially equal fire resistance, this resistance being measured by window protection, since exposure will practically never produce dangerous effects on a blank masonry wall. Where the character of exposure from nearby buildings and the value of their contents justifies it, buildings of all types should have adequate protection for wall openings. Without such protection there is little choice between heavy timber, steel or concrete buildings as safeguards against fire exposure from without.

Occurrence of fires within buildings also is independent of the structural materials used. The relative desirability of different construction types depends on three considerations: 1. Will the structure stand up and support its contents during a period sufficient for the firemen to extinguish the flames, or for the contents to be entirely consumed? 2. Will the materials of construction prevent communication of fire from one part of the floor or the building to another? 3. Will the damage occasioned by a fire be markedly greater with one type than with another?

Answering the first of these questions, fire tests on a large scale and experience with different types of buildings in actual practice indicate that properly designed reinforced concrete construction will retain its strength and support its live loads for a period greater than the duration of the average fire. If the fire is exceedingly hot, sufficient to melt the concrete, or if of greater duration than usual, no form of construction will suffice to prevent extensive damage. Steel frame construction, if protected throughout with several inches of concrete, brick work or hollow tile, will approximate the endurance of reinforced concrete construction, though its performance in this respect is not so uniformly dependable. Unless thus protected, its resistance to failure, perhaps involving collapse of the entire building and extensive loss of property, is much briefer than that of heavy-timber construction. Structural steel loses practically all its strength at a temperature approximately one-half that attained in the ordinary fire. Steel columns tested under load at the Underwriters' Laboratory, in Chicago, gave way in about ten minutes, whereas unprotected wooden

columns designed for the same loads retained their strength under fire exposure for about twenty-five minutes. Wood does not lose its strength because of heat and continues to support its loads until the beam or column has burned through. The fire resistance period of heavy plank floors is probably even greater than that of timber columns. A report of the Insurance Engineering Experiment Station, of the Boston Manufacturers Mutual Fire Insurance Company, as the result of many years observation, states that "wherever the mill-floor (heavy timber), suitably constructed of three-inch plank, grooved and splined, covered with one-inch top boarding, laid on timbers eight or ten feet on centers, has been made continuous * * * it has never been burned through by a fire upon the floor or by fire passing through the floor above, except in one instance, and that was in a warehouse where a pile of jute bales took fire in the bottom tier where it could not be reached. Fires on such mill-floors have been held not only in the building, but in the room where they originated."

The optimistic glamour which for years has surrounded the expression "fire-proof building" is rapidly being dissipated. It is becoming more widely recognized that contents rather than structure constitute the major fire hazard; that contents have an average value over three times that of the building; and that no building is proof against extensive damage by fire as long as its contents are inflammable. It is far better to spend a few thousands less on the floors, walls and roof and use the difference to install a complete sprinkler system, with its almost certain promise of early extinguishment, than to erect an expensive structure of incombustible materials and trust to luck that a fire will not occur.

Much can be said in favor of each of the construction types ordinarily used for industrial buildings. Architectural and engineering firms are quite apt to prefer one or another of these types and to present its advantages most convincingly. The fact remains, however, that with careful planning and adjustment, practically all requirements of serviceability and durability can be achieved with either type. Plant executives having in mind special requirements or economy in building should inform themselves on the possibilities of each type, and in particular should insist more frequently on detailed estimates showing the relative cost of different types for their purposes.

LOWERING BUILDING COSTS WITHOUT LOWERING QUALITY

That tens of millions of dollars could be cut from the nation's annual building bill by a simple expedient, which enough people have tried to prove it, is the tenor of

a statement contained in a report just received from the National Committee on Wood Utilization of which Secretary of Commerce Herbert Hoover is chairman. It is made on the authority of a sub-committee on construction consisting of 29 members, of which 14 are prominent architects and the balance are building engineers and authorized representatives of many great national associations of architects, builders, and contractors.

The cost of construction today has become a matter of vital concern not only to the builder and contractor, but to the consumer or ultimate home-owner, as well. In the struggle to reduce these costs, it is often claimed that the quality of building construction has been materially lowered. According to this report, however, not less than 100 million dollars could be saved by better utilization of the present amount of timber cut each year; that is, by using that portion of the product which while of equal quality is now wasted.

This waste is short lumber which in close utilization would be 20 per cent or more of the total product. The report shows from a survey of building plans calling for nearly a million feet of lumber that the short cuttings required or permitted by the plans amount to 19.59 per cent in framing material; 26.13 per cent in the common boards, and 51.49 per cent in the finish and trim of dwellings. In each case the percentage is of the total lumber consumed for that use, and the short lumber is 1 to 7 feet in variations of 1 foot. The revised lumber bills thus figured were constructed on the basis of taking every short cutting from the shortest commercial length that would provide it, leaving a cutting waste of 1 foot or less. As the lengths of lumber 8 feet and above vary by 2 feet, the wasted ends may be anything up to 2 feet, and the footage required in the short lumber is, therefore, not much greater than with long lumber. Contrary to common argument, the carpenter labor in trimming is not much greater, because most of the short lumber has at least one end trimmed on a swing cut-off saw table instead of at the sawmill green lumber trimmer, and probably true enough for use without retrimming by hand, in framing, sheathing, and other unexposed joints.

The saving in cost per thousand feet should, however, far outweigh any small added cost of trim waste or labor, the report indicates. "since it is the general practice of mills throughout the United States to quote short lengths 15 to 35 per cent below the prices asked for long lengths of equal grade."

Because the buyer for building uses has shown little or no interest in short lumber his retail yard may not be carrying it: but any new volume of inquiry would soon bring the material within reach, for the retailer can readily secure it.

End-matched flooring is becoming widely popular and furnishes a very effective field for short lengths in the flooring softwoods; and end-matched ceiling, partition, drop siding and even sub-flooring and sheathing will probably follow and give a farther outlet for short material. Another sub-committee of the National Committee on Wood Utilization is preparing a supplementary report on such end-matched building patterns.

The tables of the report are extremely useful, as they show for each type of dwellings just what lengths can be used, and for what purposes; and the left half of the table shows what short lengths were specified on the original lumber bills that accompanied the plans. For framing this specified use averaged 1.58 per cent or about one-thirteenth (1-13) the possible or "permissible" use shown on the right-hand side of the tables.

Copies of the report can be obtained from the Superintendent of Documents, Washington, D. C., ("THE MARKETING OF SHORT LENGTH LUMBER;" 28 pages, 13 illustrations, 7 tables, price—ten cents per single copy and \$4.00 per hundred in quantity.)

NEW SPECIFICATIONS FOR IMPROVED SHEET STEEL CORNICES

Handsome, durable and entirely free from the hazard of falling are inherent advantages of sheet steel cornices being recognized nowadays by architects, architectural engineers, specification writers and builders. To meet the growing demand for this type of cornice, standard specifications for fabrications and setting of sheet steel cornices have just been brought out by the Sheet Steel Trade Extension Committee.

Falling of pieces of heavy cornices, maiming and killing citizens in several cities during the past year, has given marked impetus to the use of improved sheet steel cornices. The thought that a citizen may not walk along the sidewalk or near a public building without the possibility of a piece of heavy material hurtling down with the suddenness and destruction of a lightning stroke is repugnant to liberty and safety.

The aim of the new specifications is to enable the architect and the builder to get materials and workmanship even superior to that of the old-time master sheet metal worker. Many of the old cornices have been in service for fifty years and have given ample evidence that a good sheet steel cornice has a life equal to that of the building. Not always, however, did the old cornices show beauty in design. When it was found that the many good qualities of sheet steel cornices met modern building conditions better than heavy and more expensive material, several notable and inspiring designs were executed.

Among these were the cornices on the handsome brick and tile home of the City Club of St. Louis, the Wesley Hospital in Wichita, Kansas, the Mayflower Apartments in Louisville, Kentucky, and the Hotel Kimball in Springfield, Massachusetts.

The Sheet Steel Trade Extension Committee lists among the other good points of sheet steel cornices, the following:

Incombustibility.

Freedom from falling, even in fire or earthquake.

Lightest possible overhung weight.

Greatest strength and greatest safety.

Lowest cost and maintenance charges.

Surety against dangers of leakage in set back construction.

Safety against temperature stresses.

The specifications are published in the form advised by the American Institute of Architects and carries the file number A. I. A. 12L2.

Copy will be sent architects, architectural engineers, specification writers and builders on request addressed to Sheet Steel Trade Extension Committee, Oliver Building, Pittsburgh, Pa.

NEW METHOD FOR ANALYZING HYDRATED LIME DEVELOPED BY BUREAU OF STANDARDS

A method for analyzing hydrated lime has been recently developed at the Bureau of Standards, Department of Commerce, by which more information is obtained than by the usual chemical analysis.

The method consists, briefly, in heating a sample of the material in question, which may be a hydrated lime, mortar or similar material, at succeeding temperatures for short periods of time, determining the loss in weight after each heating.

From the data thus obtained a curve, temperature against loss in weight, is plotted. In this curve sudden changes in direction appear, from which the loss in weight due to various compounds may be determined, and from which the percentages of these compounds themselves are readily calculated. By this means it is possible to determine the percentage of calcium hydroxide and magnesium hydroxide, and to a certain extent also calcium carbonate, in such a material.

Using this method a considerable number of commercial hydrated magnesium limes have been studied, and it has been found that the magnesia content is in general, hydrated to only a very small extent; in other words, very little magnesium hydroxide is present. The magnesia, however, does combine with water in time, indicating that improved methods of treatment may possibly give a material in which all the magnesia appears as hydroxide.

EXPENSIVE HIGHWAYS

The exhibits of the Good Roads Show in Chicago, January 10-14, featured practically every material used for road building, for the roadbed and for the drainage structure. One is prone to comment on the thoroughness with which the whole business for road building is being studied. The country has rightfully viewed seriously the problem of obtaining the better avenues of transportation necessitated by vehicular changes in the past decade or more. Highway departments have become an important unit in the government of a State, their personnel has increased, more roads and bridges have been built, taxes have increased correspondingly, but because many people own automobiles and enjoy good roads they have accepted this burden of increased taxes, if not willingly, then as a necessary evil.

The interests of these tax payers are not being honestly served, however, unless impartial consideration is given to all materials of construction. The person or persons upon whose shoulders lies the responsibility for selection of types of structures should not, in fairness, allow familiarity with some one material to preclude consideration of another which experience has proved to be satisfactory in every way, and which costs much less than some materials they may have used in the past.

The money spent for expensive drainage structures with the unnecessary ornate approaches and designs would go much further if spent for less expensive but equally substantial creosoted timber structures. More structures could be erected and more money made available for improvement of the road itself, or with the same amount of construction there could be a reduction of taxes, and there is no community in which this would not be welcomed.—*Wood Preserving News*.

All live men are advertisers, and the only man who should not advertise is the man who has nothing to offer to the world in the way of human service, and such a man is a dead one, whether he knows it or not. Advertising is a legitimate and ethical proposition. Life is too short for you to hide yourself away, mantled in your modesty, and let the world hunt you out. Even the dead are advertisers, for on visiting a beautiful cemetery the other day, I noticed that on nearly every marble slab was given a list of the virtues, talents and beautiful qualities which the dead man was supposed to have carried in stock. This is what you call non-productive advertising, or advertising from an emotional standpoint.—*Elbert Hubbard*.

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

When you go to a North America agent for insurance, all you pay are the premiums. His service costs you nothing. It includes complete information on the various forms of insurance protection, practical advice on the best policies for your purposes, and inspection of your property and business risks as often as you wish it.

Consult your agent as you would your lawyer or doctor.

Insurance Company of North America

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

You Can Lay Permanently Hard and Waterproof Concrete in Freezing Weather with the Aid of "ANTI-HYDRO"

In this carpet factory the concrete floors were both hardened and waterproofed in one operation with the aid of "ANTI-HYDRO." The floors are so hard that they never dust up and fill the air with gritty dust to settle in the machinery.

"ANTI-HYDRO" has an added value for cold weather work. It lowers the freezing point of concrete and cement mortars to 15 degrees F., making it possible to work during extremely cold weather and finish your contracts on time with prompt payments for completed work.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. Simply mix it with the gauging water—no skilled labor required. For 22 years "ANTI-HYDRO" has been the accepted standard. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Operative Builders
Standardize on

CIVER

A VAN SCIVER Product
for
Every Building Purpose

PLASTERING sand, concrete sand and graded gravel, mined and cleaned by the most modern methods, are always of uniform—Van Sciver—quality.

Klimco, Knickerbocker Neat and Knickerbocker Hydrated Lime are three of the scientifically prepared Knickerbocker Lime Products. Operative builders have been using Knickerbocker lime for more than fifty years.

It is a decided advantage for the operative builders to be able to secure all building material requirements from one reliable source.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., January 21, 1927.—SEALED BIDS in duplicate will be received until 3 P. M., February 25, 1927, and then publicly opened, for furnishing all labor and materials and performing all work for the construction of the United States Post Office at Lewistown, Pa. Drawings and specifications may be obtained from the Custodian of the site at Lewistown, Pa., or at this office in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

Mr. David F. Hoskins, formerly cut stone contractor in Philadelphia, announces the formation of the Eastern Cast Stone Company for the manufacture of architectural cast stone. Offices 3308-10 Ludlow Street, Philadelphia, Pa.

BUILDING PERMITS

An increased volume of construction of more than 54 per cent. over November, 1926, is shown by the December reports to Department of Labor and Industry of the number of building permits granted in 37 Pennsylvania cities and boroughs. The estimated cost of the construction operations covered by the 1,821 permits granted in December is \$26,603,049, or a gain of \$9,583,658 over November, 1926. Increased building activity over November is shown for 8 of the 37 municipalities. These cities and boroughs and their respective percentage of increase over November are the following: Altoona, 81 per cent.; Ambridge, 38 per cent.; Meadville, 390 per cent.; Monongahela, 191 per cent.; Philadelphia, 141 per cent.; Pittsburgh, 28 per cent.; Reading, 25 per cent., and Wilkesburg, 37 per cent.

When compared with records for December, 1925, the figures of 20 cities for December, 1926, show an increase of \$13,000,000, or nearly 100 per cent., over last year. The 6 cities that show a much larger volume of building over Decem-

*Not included in Comparative Totals.

ber, 1925, are: Altoona, Harrisburg, Lancaster, Philadelphia, Pittsburgh, and Reading. During December, 1926, Philadelphia issued permits for construction operations costing nearly twenty-one million dollars.

The total volume of construction permits granted during 1926 in 20 cities amounted to \$237,980,501. This is \$43,-864,545 below the 1925 total, or a loss of 15.5 per cent. There are but 3 of 20 cities that report gains in construction activity over the year, 1925. The cities that show increases over 1925 are Allentown, 6 per cent.; Altoona, 1.3 per cent., and Pittsburgh, 5.5 per cent. The other 17 cities show losses ranging from 0.7 per cent. for Harrisburg to 65.0 per cent. for Bethlehem. Following are listed the cities that show a lower volume of construction for the year 1926 than for 1925:

City	Decrease (per cent.)
Bethlehem	65.0
Oil City	54.4
Uniontown	52.6
Lancaster	41.0
Erie	29.6
Reading	20.8
Scranton	19.9
Warren	18.0
Philadelphia	17.9
Bradford	17.0

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

The impractical dreamers are not the architects, but the clients themselves, as a rule.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

No Property Is Immune

to windstorm damage. No section of the country can claim, "The wind can never cause destruction here."

Insurance against destruction or damage occasioned by violent winds will add very little to your insurance budget, but add a great deal to the safety of your property investment.

Your agent can give you windstorm insurance in a reliable company.

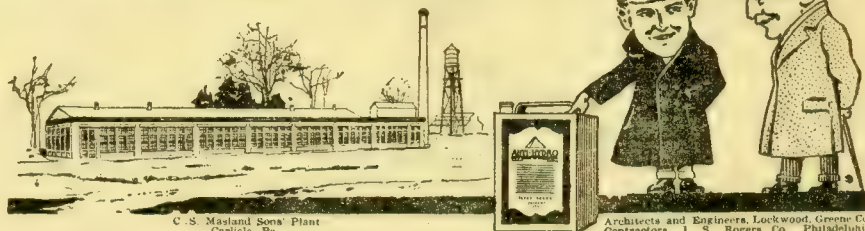

Insurance Company of North America

You Can Lay Permanently Hard and Waterproof Concrete in Freezing Weather with the Aid of "ANTI-HYDRO"

In this carpet factory the concrete floors were both hardened and waterproofed in one operation with the aid of "ANTI-HYDRO." The floors are so hard that they never dust up and fill the air with gritty dust to settle in the machinery.

"ANTI-HYDRO" has an added value for cold weather work. It lowers the freezing point of concrete and cement mortars to 15 degrees F., making it possible to work during extremely cold weather and finish your contracts on time with prompt payments for completed work.

Being a liquid integral compound, "ANTI-HYDRO" is easy to use. Simply mix it with the gauging water—no skilled labor required. For 22 years "ANTI-HYDRO" has been the accepted standard. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

REINFORCED CONCRETE—ITS SHORTCOMINGS AS A MATERIAL

In Militant Review Professor Swain Concludes That Concrete is Variable, Un-dependable, Changing During Its Life, and Non-permanent—Paper and Discussion Summarized

Recently Prof. George F. Swain, of Harvard University, addressed the Boston Society of Civil Engineers on the subject, "Why I Prefer Steel to Reinforced Concrete." The address was a detailed review of those features of concrete and its behavior that had given trouble or have been subjected to special study. It constituted a large-scale indictment of concrete. Structural steel (and to some extent other building materials) were described as preferable to concrete and reinforced concrete in a great many uses where concrete has come to occupy a distinct place in the construction art. The paper was, with slight change, identical with one read by Professor Swain before the organization of the steel fabricators, the American Institute of Steel Construction, at its annual convention two months ago, under the title "Steel for Strength and Security." At

that convention the paper was not discussed. The Boston meeting, however, at which 250 to 300 engineers gathered, entered into very active discussion of Professor Swain's paper, in which discussion he was almost unanimously opposed.

A greatly condensed version of the paper follows, together with notes of the Boston discussion. References and citations, which form a large part of the original, are of necessity here omitted, but the general course of the argument is reproduced.

At the outset the author named as main virtues of a structural material economy, durability and strength, and further listed under strength such qualities as toughness, constancy, and high tensile strength, which latter he considers desirable even in a compression material. On the basis of this outline, he referred very briefly to the particular excellences of wood, of stone, and of burnt clay products, and more at length to those of steel. With this preparation, he plunged into his critical review of concrete, of which what follows is exact quotation though much of the text is necessarily omitted.

* * *

The first peculiarity of concrete to be

noted is that it is not a finished product. It is made on the job. The engineer must not only design the structure but he must design the material. The constituents, stone, sand, cement, and water, are each subject to defects that must be guarded against, and they are extremely variable. The stone and sand must be graded properly in size, and mixed in proper proportions with the cement and water; and this must be done, not in the laboratory or factory, but on the job, with all the necessary uncertainties, and often with very unskilled labor. The material is not finished until it is in the structure, and then it cannot be tested or rejected.

Another most important characteristic of concrete is that it changes after it is placed beyond recall in the structure. In this respect it differs radically from all other structural materials. The real manufacture of the material begins then, when it begins to set and harden. The phenomena of setting and hardening are not fully understood. It seems to be partly a crystallization, but mainly the hardening of a colloidal mass composed of cement particles which absorb water and swell, the water gradually penetrating into the particles.

All concrete, unless waterproofed, is more or less porous, and will swell and shrink when wetted and dried, and with varying moisture in the atmosphere. Further, a large part of the cement in concrete is soluble in water, and can be dissolved out or can form other compounds with acids in the water.

Variability—Consider the situation for a moment. Concrete is a material made on the job, dependent upon the quality of stone, sand, cement, and water, the proportions, the care in mixing and placing, and much influenced by small variations in the quantity of water used. It sets after being placed beyond recall. Its ultimate condition depends much upon the curing, or treatment during setting, and the amount of water given it. It expands and contracts subsequently as it is wetted and dried. Is it not obvious that there must be considerable uncertainty in the resulting product? Modern methods of field control have made it easier to secure uniformity and good quality, but great lack of uniformity still exists. If a pint of water in a batch makes so much difference, how can we expect uniformity with ordinary workmen, varying weather and varying moisture in the materials? What would be thought of steel if the ingredients, iron and carbon, or ferrite, cementite, and amorphous material had to be selected from widely varying materials, mixed in the field, put into the structure when molten, and allowed to harden there? How much better and more reliable than concrete is a material like steel, which comes to us a finished product that can be tested, which suffers no change of constitution when put in the structure, which is not porous and cannot have its constituents washed out, and is only subject to surface oxidation, which can be prevented!

Volume Change—The strength of concrete varies with the temperature and with the degree of saturation. . . . But this is not all. Setting in water, reinforced concrete expands, causing tension in the steel and compression in the concrete. Setting in air, it contracts, causing compression in the steel and tension in the concrete. Professor White (Alfred H. White, professor of chemical engineering, University of Michigan) says that "these volume changes, which seem due to a fundamental property of portland cement, are the most potent causes of the destruction of concrete exposed to the weather. If concrete is to be kept constant in volume, its moisture content

must be held relatively constant," and this cannot be done unless it is waterproofed and all water prevented from entering, and in this case complete hydration will probably be prevented.

The expansion of 1:2:4 concrete in water may amount to 0.01 per cent. in 120 days, and the contraction in air to 0.05 per cent or more. This means that a bar 100 ft. long may contract 0.6 in. . . . In a 10x10-in. bar 10 ft. long with one 3/4-in. rod, the bond stress may be 130 lb. due to shrinkage. . . . There is no doubt of the seriousness of these stresses. In columns, the shrinkage stresses may exceed those allowed in the design, while in beams the tension reinforcement will be relieved but the concrete tension increased. These stresses have generally been entirely ignored because they were not known.

Theory—Turning now to the usual methods of computing reinforced-concrete structures, the situation is also uncertain and unsatisfactory. . . . As a matter of fact, nobody knows how a reinforced-concrete beam acts. It probably acts partly as a beam, partly as an arch, partly (if rods are bent up at the ends) as a catenary or suspension system, and nobody knows to what extent in each way. And I have always wondered just what bond there is in a reinforced-concrete beam after it has been in use for some months or years, and exposed to a series of alternate wettings and dryings, with accompanying shrinking and swelling. . . . The bond is certainly not distributed as the usual theory assumes, and the stress in the steel at a point where the moment is not a maximum may, if there is truss action, be greater than computed. The bond may not act in the same direction at all points of a bar, and suddenly increases where a bar is cut off. I am forced to the conclusion that the theory of reinforced concrete is still almost wholly empirical. We know little about it except that certain beams have carried certain loads in laboratory tests.

Further, it is to be observed that before a beam can act according to the usual theory, with the rods stressed to say 16,000 lb., the concrete must crack. This is the only structure composed of two materials in which the accepted theory presupposes the actual rupture of one of the materials. This certainly does not look very good.

Consider now the concrete column reinforced by longitudinal rods. The shrinkage of the concrete due to varying mois-

CONTEMPLATED CONSTRUCTION; ARCHITECTS AND OWNERS; LAST DAYS FOR FILING BIDS; CHARACTER OF MATERIAL AND EQUIPMENT REQUIRED; ADVANCE INFORMATION IN EVERY PHASE OF NEW CONSTRUCTION

Office Building, 260 S. 15th St., Phila. Architect Max A. Bernhardt, 127 S. 18th St., Philadelphia. Owner, Geo. Weinrott, Public Ledger Bldg. Brick, reinforced concrete, 5 stories, 30x60 feet, slag roof, cement floors, elevators, steam heat, electric light. Plans in progress, ready for bids in a few days.

Bridge, 5th and Hunting Park Ave., Phila. Architect, private plans. Owner, City of Phila., Dept. of Public Works. Steel, concrete, 120x150 feet. Owner taking bids due Feb. 16th.

Store and Apartments (2), Germantown, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, name withheld. Brick, cast stone, 2 stories, 16x68 feet, slag roof, hardwood floors, hot water heat, electric light, tile and marble work, metal bulks, plate glass, gas logs. Plans in progress.

Residence Operation, Marshall street, Baring to Hampden road, Philadelphia. Owner, J. H. McClatchy, Land Title Building, Philadelphia. Various types and sizes. Work contemplated.

Factory (alts. and add.), 1238-46 Belmont avenue, Philadelphia. Architect, E. H. Poggi, 1520 Locust street, Philadelphia. Owners, Central Construction & Supply Co., care of T. Shipley, 2222 Arch street, Philadelphia. Brick, 3 stories, 100 feet x irregular. Revised plans in progress.

Factory (add. and alts.), 525 North Ninth street, Philadelphia. Architect, S. Abrahamson, 918 North American Building, Philadelphia. Owners, Starn Metal Mfg. Co., care of architect. Preliminary plans now in progress.

Store and Residence, Residence and Basement Store, Residences (28), Oxford Circle and Northeast Boulevard, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, name withheld. Brick, 2 stories, (28) 16x36 feet, (2) irregular, slag and tin roof, hardwood floors, hot water heat, electric light, tile work, cement, metal lath, 14 basement garages, metal bulks, plate glass. Plans in progress.

Service Station, Frankford, Philadelphia. Architect, Christian H. Fries, Frankford and Oxford street, Philadelphia. Owner, name withheld. Brick, steel, 1 story, 60x120 feet, slag roof, cement floors, steam heat, plumbing. Sketches being drawn.

Office Building (alts. and add.), 313 South Smedley street, Philadelphia. Architects and owners, Edwin H. Silverman and Abraham Levy, Elrae Building, Philadelphia. General alterations and additions. Plans in progress.

Bridge Rebuilding, between Telford and Sellersville, Bucks County, Pa. Engineer, John S. Roberts, Jr., County Engineer, Bristol, Pa. Owners, Bucks County Commissioners,

Bristol, Pa. Concrete, 43-foot span, 24-foot roadway. Plans in progress.

Factory Building, Southwest Corner Rubican and Collins streets, Philadelphia. Architect, private plans. Owner, N. Neuman, care of Paragon Knitting Mills, 3907 Powelton avenue. Brick, 3 stories. Plans in progress. Bids will be taken in about ten days.

Department Store, 537-39 South street, Philadelphia. Architect, Harold Holmes, Detroit, Mich. Owners, S. S. Kresge Co., Detroit, Mich. Brick, steel, 2 stories and basement. Owners ready for bids in a week.

Residences (39), Alcott and Colgate streets, Philadelphia. Architect, private plans. Owner, E. M. Davenport, 514 Van Kirk street, Philadelphia. Brick, 2 stories, 16x42 feet, slag roof, hardwood floors, hot water heat, electric light, tile work. Owner will be ready for sub-bids in one week.

Apartment House, Southeast Corner Fifty-eighth and Florence streets, Philadelphia. Architect, I. W. Levin, 1011 Chestnut street, Philadelphia. Owner, H. Barton, 8201 Christian street, Philadelphia. Brick, steel, limestone, cut stone, bluestone, 4 stories, 75x205 feet, 72 apartments, slag roof, hardwood and linoleum floors, vapor heat, oil burning, electric light, tile and marble work, kalamein doors, electric elevators, refrigeration. Plans completed. Owner ready for sub-bids.

Moving Picture Theatre, Southeast Corner Forty-second and Walnut streets, Philadelphia. Architects, Edward & Green, Camden, N. J. Owner, N. Robinson, Franklin Trust Building, Philadelphia. Seating capacity, 2,000. Plans in progress. Will be ready for bids in about six weeks.

Residences (58), Woodlawn and McMahon streets, Philadelphia, \$260,000. Architect, private plans. Owner, Joseph E. O'Neill, care of G. H. Weinrott, Public Ledger Building, Philadelphia. Brick, 2 stories, hot water heat, electric light, tile work, slag roof, hardwood floors. Owner and builder taking sub-bids due as soon as possible.

Residences (33), North side Malvern avenue, Philadelphia, \$160,000. Architect, Max A. Bernhardt, 127 South Eighteenth street, Philadelphia. Owner, Roland C. Lewis, care of G. H. Weinrott, Public Ledger Building, Philadelphia. Brick, 2 stories, central heating plant, electric work, tile work. Owner and builder taking sub-bids due as soon as possible.

Residences (57), Linton street, between Front and Mascher streets, Philadelphia. Architect, private plans. Owner, Joseph Sheperla, 1152 Wagner avenue, Philadelphia. Brick, 2 stories (bricklaying reserved), hot water heat, electric light, metal lath, tile

work, slag roof, hardwood floors. Owner is taking sub-bids due as soon as possible.

Residences (33), Stores (2), 3900 North Smedley street, Philadelphia, \$225,000. Architect, Philip Stein, Otis Building, Philadelphia. Owners, Goldstein Brothers, 1951 North Fifty-second street, Philadelphia. Brick, 2 stories, hot water heat, electric light, tile work, slag roof, hardwood floors. Owners and builders to take sub-bids due February 15th.

Residence, Rhawn street, Castor road, Castor Gardens, Philadelphia. Architect, Christian H. Fries, Frankford and Oxford avenue, Philadelphia. Owner, Emil Anderson, 639 North Nineteenth street, Philadelphia. Brick, 1½ stories, 25x37 feet, asphalt shingle roof, hardwood floors, cement work, hot water heat, electric light, tile work. Owner will take sub-bids.

Tenement Houses (2), Knorr and Hegerman streets, Tacony, Pa. Architect, private plans. Owner, name withheld. Brick, 2 stories, 32x36 feet each, slag roof, hardwood floors, hot water heat, electric light, tile work. Charles R. Davis & Son, 4729 Ludlow street, Philadelphia, taking sub-bids.

Residences (187), East Gorges lane, South of Berks, Philadelphia, \$700,000. Architect, private plans. Owner, K. Kaiserman, 1505 Bankers' Trust Building, Philadelphia. Brick, 2 stories, hot water heat, electric light, slag roof, hardwood floors, tile work. Preliminary plans in progress. Will be ready for bids about March 15th.

Loft Building, 2209-11 Chestnut street, Philadelphia. Architect, Richard A. Kerns, Jr., 109 South Twenty-second street, Philadelphia. Owners, Wynnewood Realty Co., 109 South Twenty-second street, Philadelphia. Brick, concrete, 3 stories and basement, 34x120 feet, slag roof, wood floors, vapor heat, electric light, rolled steel sash. Architect will be ready for general bids in ten days.

School, East Roosevelt Boulevard, Philadelphia. Architect, George I. Lovatt, 223 South Sydenham street, Philadelphia. Owners, St. Ambrose's Roman Catholic Church, Rev. J. A. Hughes, on premises. Plans in progress. Will be ready for bids in three weeks.

Demolition, 1814-20 Arch street, Philadelphia. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Boyertown Burial Casket Co., 1211 Arch street, Philadelphia. Architects inviting bids due February 10th.

Alterations to Fourth Floor, Sixteenth and Girard avenue, Philadelphia. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, St. Joseph's Hospital, on premises. Bond, brick work, carpentry and mill work,

Pennsylvania Contracts Awarded

Bank, Bethlehem, Pa. Architect, H. J. Wiegner, Bethlehem Trust Building, Bethlehem, Pa. Owners, Bethlehem Trust Co., Broad and Main streets, Bethlehem, Pa. Steel, concrete, fireproof, 5 stories, 40x45 feet, concrete roof, composition and linoleum floors, heating extension, electric light, metal lath, tile work. Contract awarded to F. B. Glassmire, Bethlehem Trust Building, Bethlehem, Pa.

School, Allentown, Pa. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, St. Catherine of Sienna Roman Catholic Church, Allentown, Pa. Brick, steel, 2 stories and basement, 128x61 feet, slag roof, pine and cement floors (plumbing, heating, electric reserved), metal lath, tile work, bond, ornamental iron work. Contract awarded Butz & Clader, Allentown, Pa.

Printing Shop, Wilkes-Barre, Pa. Architects, Mack & Sahm, Coal Exchange Building, Wilkes-Barre, Pa. Owners, Roeder & Co., R. Frethaway & Son, Wilkes-Barre, Pa. Brick, hollow tile, 1 story, 100x140 feet, built-up roof, maple floors, hollow tile, roof ventilators, waterproofing, electric light, steel sash and skylights, fire doors. Contract awarded to John Curtis & Co., 1 Hickory street, Wilkes-Barre, Pa.

Alterations and Additions, Chester Valley, Valley Forge, Pa. Architect, Louis S. Adams, Radnor, Pa. Owner, Daniel Badger, Jr., on premises. Electric light, cement work, steel and iron work, carpentry and mill work, pine floors, dreadnought tile floors, metal lath, plastering, tile work, hardware, painting and glazing. Contract awarded H. M. Walderfer, Norristown, Pa.

Bank, Doylestown, Pa. Architects, MacKenzie & Wiley, Bankers' Trust Building, Philadelphia. Owners, Doylestown National Bank, Doylestown, Pa. Contract awarded J. S. Bailey, Doylestown, Pa.

New Jersey Construction News

Residence, Wildwood, N. J. Architect, Christian H. Fries, Frankford and Oxford avenue, Philadelphia. Owner, name withheld.

Concrete block, stucco, 2½ stories, 30x42 feet, asbestos shingle roof, hardwood floors, hot water heat, electric range, refrigeration and laundry equipment. Sketches in progress.

Bank Building, Southwest Corner Broadway and Cooper streets, Camden, N. J. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owners, First National State Bank, F. Morse Archer, Camden, N. J. Brick, limestone, steel, terra cotta, stone, 188x80 feet. Plans in progress.

Hotel, Pacific avenue, Atlantic City, N. J., \$1,500,000. Architects, Thalheimer & Weitz, 10 South Eighteenth street, Philadelphia. Owner, name withheld. Will contain 350 rooms and baths, 16 stories high. Preliminary sketches drawn.

Auto Show Room (alts. and add.), 14-16 North Pearl street, Bridgeton, N. J. Architect, Edward Ash, 1700 Walnut street, Philadelphia. Owners, Ranier Cadillac Co., on premises. Brick, limestone, 1 story, 42x100 feet. Plans in progress.

Restaurant (alts.), 227 Market street, Camden, N. J. Architect, private plans. Owners, Smedley's Restaurant, 227 Market street, Camden, N. J. Lowering floors, general remodeling. Work contemplated.

Apartment, Station avenue, Camden, N. J. Architects, Edwards & Green, 548 Federal street, Camden, N. J. Owners, name withheld. Brick, hollow tile, 6 stories. Plans in progress.

Church, West State street and Overbrook avenue, Trenton, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, All Saints' Church, Rev. R. Urban, 15 South Overbrook avenue, Trenton, N. J. Stone, 1 story and gallery, electric light. Architects selected.

Church, Trenton, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, St. Paul's Protestant Episcopal Church, Rev. Louis B. Howell, Trenton, N. J. Stone. Revised plans in progress.

Bridge, South of Snyder avenue, South Philadelphia, over Delaware River, to Red Bank, N. J., \$18,000,000, exclusive of approaches. Owners, Bridge Commissioners, F. W. Melvin, South Philadelphia Business Men's Association and Postmaster Albright, Woodbury, N. J. Appropriation of New Jersey for first survey, \$50,000. Work contemplated.

Apartment Building, 184 States avenue, Atlantic City, N. J., \$75,000. Architect, Benjamin Brown, Guarantee Trust Building, Atlantic City, N. J. Owners, C. Hass, Inc., Atlantic City, N. J. Brick, steel, 3½ stories, 40x130 feet, slag roof, hardwood floors, steam heat, electric light, tile and marble. Architect about ready for bids.

Golf Club, Ocean City, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City. Owners, Ocean City Harbors Co., care of architect. Brick, stucco, 2 stories, 90x90 feet. Architect will be ready for bids at end of week.

Apartment Building and Garage, Margate City, N. J. Architect, D. A. Rosenstein, Humphry Building, Atlantic City, N. J. Owners, George P. Einwechter & Son, 21 North Wyoming avenue, Atlantic City. Brick, 2½ stories, 23x50 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Owners taking sub-bids.

Apartment House, Liberty and Main avenue, Atlantic City, N. J., \$50,000. Architect, Benjamin Brown, Guarantee Trust Building, Atlantic City, N. J. Owner, Louis Ostrow, 420 Maine avenue, Atlantic City, N. J. Brick, concrete, 3 stories, 60x60 feet, hardwood floors, electric light, tile work. Owner will build.

Fire House, Hightstown, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Borough of Hightstown, Hightstown, N. J. Stone, cinder block and steel, 2 stories, 60x110 feet, slate roof, concrete and linoleum floors, hollow tile, roof ventilators, waterproofing, dampproofing, ornamental iron, iron stairs, fire doors, steel sash and skylights, tile work, metal lath, vapor heat, electric light. Owner will take bids in a month.

Bank, Camden, N. J. Architects, Simon & Simon, 249 South Juniper street, Philadelphia. Owners, Victory Trust Co., care of M. Wessell, Third and Pine streets, Camden, N. J. Brick, cut stone, reinforced concrete, steel, 1 story, mezzanine and basement, 80x40 feet, slag roof, cement, oak floors, plumbing, metal window guards, shoring, waterproofing, dampproofing, architectural terra cotta, ornamental iron work, iron stairs, fire doors, rolled steel sash, tile and marble work, metal lath, hot air heat, electric light, acoustical treatment, bronze work, dumb waiter, linoleum floors, area gratings, metal furniture, rubber floors, metal toilet stalls. Architects taking bids due February 14th.

N. J. Owners, Baul Brothers & Wickman, Atlantic City, N. J. Brick, steel, 1 story, 35x60 feet, slag roof, pine floors, metal ceilings, copper work, plate glass, hot water heat, electric work. Architect taking bids.

Office Building, Pleasantville, N. J. Architect, J. T. Windrim, Commonwealth Building, Philadelphia. Owners, Delaware & Atlantic Tel. & Tel. Co., Seventeenth and Parkway, Philadelphia. Brick, cut stone, reinforced concrete, steel, 2 stories and basement, 41x58 feet, slag roof, cement floors, plumbing, ornamental iron work, bond, metal lath, steam heat, electric light. Architect taking bids due February 11th.

Residence, Camden, N. J. Architect, Ralph Goldberg, 266 South Fifteenth street, Philadelphia. Owner, Neilson Carlton, care of architect. Stone, 2½ stories and basement, 37x90 feet, slate roof, oak and pine floors, hot water heat, oil burning, electric light, metal lath, tile work, ornamental iron work, flagstone. Architect taking bids due February 10th.

New Jersey Contracts Awarded

Garage, South South Carolina avenue, Atlantic City, N. J., \$60,000. Architect, Bertram Ireland, Guarantee Trust Building, Bethlehem, Pa. Owners, Best & Lippman, care of architect. Brick, steel, concrete, 3 stories, 50x165 feet, mastic roof, elevators, metal windows, waterproofing, iron stairs, bulks, steam heat, electric light. Contract awarded to Harry Hantman, 134 North Maine avenue, Atlantic City, N. J.

Lodge Building, Bridgeton, N. J. Architect, Thomas Edward Ash, 1700 Walnut street, Philadelphia. Owners, Fraternal Order of Eagles, Bridgeton, N. J. Contract awarded Graham-Chambley Co., 3649 Filbert street, Philadelphia.

Store and Apartment, 1903 Atlantic avenue, Atlantic City, N. J. Architect, J. R. Orden, 143 South South Carolina avenue, Atlantic City. Owner, W. Molamet, care of architect. Brick, 3 stories, 20x118 feet, slag roof, hardwood floors, oil burners, electric light, tile work, plate glass. Contract awarded to Alexander Nedelman, Guarantee Trust Building, Atlantic City, N. J.

Administration Building, Atlantic City, N. J., \$194,900. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic City School Board. H. H. Young, secretary, Atlantic City, N. J. Fireproof, 3 stories, 47x120 feet, slag roof, hardwood floors, terra cotta, elevators, stone, tile and marble, electric light. Contract awarded to S. H. Headley, Guarantee Trust Building, Atlantic City, N. J.

Electrical Work, 7th and Linden Streets, Camden, N. J. Architects, The Ballinger Co., 12th and Chestnut Streets, Phila. Owner, Camden Bridge Garage, on premises. Contract awarded Stange Electric Co., 214 S. 7th St., Phila.

Miscellaneous Construction News

Residence, Wilmington, Del. Architect, C. R. Hope, DuPont Building, Wilmington, Del. Owner, Mrs. Spackman, care of architect. Brick, 2½ stories. Plans in progress.

Parish House, Claymont, Del. Architect, R. C. Tindall, 914 Orange street, Wilmington, Del. Owner, Methodist Episcopal Home, Rev. Hugh B. Kelso, Claymont, Del. Stone, 2½ stories, 40x70 feet, slate roof, hardwood floors,

steam heat, electric light, tile work. Architect will be ready for bids next week.

Oil Station, Delaware and Lincoln avenues, Wilmington, Del., \$5,000. Owners, Texas Co., 17 Battery Place, New York. Brick, 1 story, 16x18 feet, asbestos shingle roof, cement work, electric light. Permit issued.

Miscellaneous Contracts Awarded

Factory, Wilmington, Del., \$552,000. Architects, Monks & Johnson, 99 Chauncy street, Boston, Mass. Owner, J. Frank Darling, 253 Thirty-sixth avenue, New York. Reinforced concrete, steel, brick, 5 stories and basement, 150x150 feet, 1 story and basement, 150x150 feet, slag roof, cement floors, steam heat, electric light, metal lath, steam heat, rolled steel skylights, ornamental iron work. Contract awarded to Karno-Smith Const. Co., Broad Street Bank Building, Trenton, N. J.

Residence, 1901 West Ninth street, Wilmington, Del., \$6,500. Architect, private plans. Owner, Gastano Di Lella, 816 Bayard street, Wilmington, Del. Brick, 2 stories, 17x42 feet, slag roof, hardwood floors, electric work. Contract awarded to J. A. Ventres Co., 1909 West Sixth street, Wilmington.

(Continued from page 84)

ture will, as we have seen, produce initial compression in the rods, which may be large. Now these slender rods, if standing alone and subjected to the loads that they are assumed to carry, would bend laterally. They would not carry those loads. They are only prevented from bending by the surrounding concrete. But they tend to bend all the time, and so tend to split off the surrounding concrete unless all the rods tend to bend toward the center of the column, which cannot be assumed. Here, then, we have a compound material in which one material tends, by its own action, to make the other fail, and does make the other fail, at the ultimate load.

Concrete has to some extent a flow or plasticity under stress. . . . This is in some respects a favorable quality, as it indicates that a concrete structure, if watched and measured, should give warning of impending failure. But it is surely most undesirable to have a continuing flow take place under comparatively small loads, or those used in the design.

Strength for strength, concrete weighs about seven times as much as steel. On this basis, then, does it not appear that in using concrete we are loading our structures, and especially their foundations, with great loads of sand and stone which only contribute weight and not strength.

Permanence—No material, probably, is permanent under all conditions. There are always destructive agencies that may destroy it. Steel and iron are, as we all recognize, subject to rust, which is merely surface oxidation, and which may be prevented if care is taken. There is no internal change, no dissolving out of any ingredient. Concrete is very different.

Practically all concrete is porous. The cement may be dissolved out. The concrete in reinforced-concrete beams is assumed to crack if subjected to the assumed loads. Freezing and thawing may disintegrate it. The effect of salt or alkali earth is very harmful. Indeed, concrete corrodes, as steel does, but in a more harmful way. Concrete will be permanent under favorable conditions. But conditions necessary for permanence seldom or never exist. A great deal of concrete work has been built. Some of it has lasted well, but a great deal has integrated and is going to pieces, and there have been many failures.

That many concrete structures, which were at the time of their construction considered as perfect as they could be made, are disintegrating is being reluctantly admitted. Any one who will examine many of these structures will find abundant proof, and there have been many failures and collapses.

Various reports and papers classify the causes of defective concrete and of failures. . . . When one scans this list and considers the character of the usual workman, he may be inclined to agree with Professor White, who says: "It (concrete) has latent possibilities of harm which no other major building material possesses. Its faults are, so far as we know, necessarily inherent in the material."

Frost may be a potent cause of disintegration. If there is no liquid water in the pores, it may be frozen without harm, but if there is liquid water, it will expand; but if a hair crack develops, water may enter and cause progressive disintegration. Even hair cracks must be prevented if disintegration is to be avoided when concrete is exposed in the open air in conditions where ice may form.

Corrosion of the steel has been a frequent source of trouble. It is said that concrete protects steel from corrosion. So it may, as long as it surrounds the steel. But when cracks develop, as contemplated by the accepted theory, water may gain access to the steel, which then cannot be protected. Especially if the water contains salts, the danger may be great. . . . Trade wastes, depending upon their character, may cause disintegration. Sewage may do the same, and many concrete sewers are showing poor results.

It is possible to get a good original job, but there still remain the stresses and cracks due to changes of moisture and the action of the loads, and the time effect, which defects are inherent in the material and preclude the possibility of predicting the life of a concrete structure.

Economy—One reason why concrete structures have in many cases been more economical than steel has been that the building laws have discriminated unfairly in favor of concrete and against steel. The enthusiasm for reinforced concrete

has spread even to building commissions and legislatures.

For instance, the St. Louis code provides for fireproof buildings . . . [that] all exterior steel columns must have 8 in. of concrete over their outer surfaces, while reinforced-concrete columns need have only 2 in. of concrete outside the steel! What an unfair discrimination! . . . If these unfair discriminations were removed, and if more care were exercised to get skilled labor, to select suitable materials, and to have expert supervision, there is no doubt that reinforced concrete would not work out to be more economical than steel, in many cases in which it does now work out to be more economical.

Conclusions—I would rather use burnt clay products than concrete for many purposes, as for roofing tiles and for drains or sewers, and in many cases for walls and as hollow blocks for floors.

For a structure which can be made of steel so as to be accessible for inspection and painting, I would much prefer steel to reinforced concrete. This includes railway and highway bridges, tanks and standpipes, stadia and grandstands, ships and barges, cars, etc.

How is it about structures like buildings, in which, if of steel, the metal is not everywhere accessible? Well, in such a case it is undeniable that steel is just as accessible as the reinforcing rods in reinforced concrete; in fact, more so. Therefore, I would prefer steel for buildings. I would much rather have a steel-frame building than a concrete building, especially if subject to earthquakes or hurricanes. . . . I would rather have a steel column than a reinforced-concrete column; a steel girder protected by concrete or gunite, or haunched in concrete, than a reinforced-concrete girder. I would rather have a column footing of steel beams than of reinforced concrete.

Notwithstanding, even if my judgment is correct, there still remains a multitude of other uses for concrete and reinforced concrete, as for foundations, mass work in general, walls and abutments, piers or their backing, dams, subways, roads, etc.

Why not use each material where it is most suitable and reliable?

* * *

Discussion of Prof. Swain's Paper

Active discussion followed the reading of the paper, continuing for more than two hours until ended by the chair. Only one speaker, B. W. Guppy (bridge engineer, Boston & Maine Ry.), supported Professor Swain's condemnation of concrete.

Mr. Guppy added to Professor Swain's objections the argument that the strength of a completed concrete structure cannot be appraised when the plans have been lost, as in the case of a concrete railway

trestle, which for this reason could not be rated for traffic-carrying capacity.

CHARLES R. GOW—After pointing out that enthusiastic advocates of concrete probably have overlooked the merits of rival materials, Charles R. Gow, consulting engineer, suggested that the truth probably lies between their views and those of steel advocates as represented in the paper. It is inconceivable that any structural material which has enjoyed such wide popularity as concrete should be afflicted with vital defects. Failures of concrete are not surprising, since any new art progresses by trial and error. The early years of use of structural steel will show similar failures, and with all its wealth of experience the steel art is not yet free from new experiences, as witness the failure of the Quebec bridge, mentioned by the author.

Professor Swain's paper raises the question of whether we shall abandon the use of this new and valuable material or shall continue to use it and seek to discover remedies for such faults as it may be found to have. Steel, as the author said, is excellent *if properly designed*, and similarly the troubles with concrete may be ascribed to imperfect design. But concrete is perhaps a more complex material, calling for greater care and study in working out its problems.

It remains true that concrete has filled a very valuable place in the construction activity of the world during the last quarter century. Among its advantages is ready availability, and in some uses, for instance flat-slab construction, steel could hardly take its place. It is adapted to irregular-shaped structures. It has proved very economical. It has the pre-eminent value of fire resistance, not mentioned by the author. Permanence is perhaps a relative term, but many concrete structures have stood for years with no evidence of deterioration; and if others have failed, each gave its lesson to designers as to errors to be avoided in subsequent work. As to porosity, it is believed possible today, with proper care, to produce absolutely waterproof concrete. As to strength, it is in excess of expectations; concrete is usually overdesigned.

L. J. JOHNSON—Describing himself as a warm admirer of steel and a hopeful admirer of concrete, Prof. L. J. Johnson (Harvard University), said that the development of reinforced concrete, which was essentially empirical, would not have come about if left to university-bred men. We may fairly give consideration to all the dangers and obscure points about concrete behavior and yet continue to use the material for very many uses. Fine cracks are of no meaning as to strength, and whether water will work into such cracks has to be answered by experience, which indicates that it generally does not, for the swelling due to steel corrosion would promptly reveal it. The troubles with

concrete virtually all simmer down to lack of density. Too much attention has been given to 28-day strength, and the question of amount of water is best met by the rule, "Workability at all hazards, and then as little water as practicable."

W. C. VOSS—Calling Professor Swain's paper a profound indictment not of concrete, but of the engineering schools of this country, Walter C. Voss (Portland Cement Association), said that the Portland Cement Association is the only national organization that has spent millions to bring to the attention of engineers not only the advantages but also the troubles of the material which it represents. Steel, he said, is subject to criticism, defects and troubles quite as much as concrete, through faults in shopwork and shortcomings of inspection, but these are not a criticism of steel. He cited the service of concrete roads, of a 45-year-old concrete sewer pipe dug up in Worcester, and similar facts as tangible evidences of the ruggedness and durability of concrete—a material which, he said, is not going to stand still or stop, but will continue to progress.

L. C. WASON—Early concrete buildings one of 1860, in Peabody, Mass., and structures in which primitive design or accident or construction defects threatened serious trouble, were cited by Leonard C. Wason (Aberthaw Co.) as demonstrating both the durability and the resistance to abuse of concrete construction. The material has greater strength than it is given credit for—can Professor Swain cite any concrete building that failed and after acceptance and six months' practical use? Long-time immersion tests as well as practical experience, give proof of the complete protection of reinforcing steel from corrosion. On the score of economy, the Attleboro standpipe—the first and largest reinforced-concrete tank, replacing an old steel structure that rusted out despite yearly inside painting—was found to be several thousand dollars cheaper than a new steel structure.

E. S. LARNED—On this same score of economy, E. S. Larned asserted that without reinforced concrete the country could not have the intense building activity of the present and recent years. Quick availability is often as important as economy, moreover; there are cases where a job waited six months for the steel to be delivered, while an adjacent job of concrete was started and finished in the meantime.

E. F. ROCKWOOD—The greater weight of concrete as compared with steel may often be an advantage, E. F. Rockwood said. Textile manufacturers have frequently stated that their concrete buildings save wear and tear on machinery and give improved operation because it is heavier and more rigid.

W. S. THOMPSON—Out of 7,500 reinforced-concrete structures that have gone through the engineering department of one reinforcing bar company in some 20 years, W. S. Thompson (Kalman Steel Co.), stated, anything approaching failure occurred in only three, and in all these cases the trouble was not with concrete as a material, but with the mishandling of concrete by designer or builder.

R. D. SNODGRASS—Early issues of *Engineering News*, R. D. Snodgrass (Truscon Steel Co.), found in a recent review, are full of reports of failures of steel structures or discussions of such failures. If a corresponding thing has occurred during the last 25 years with reinforced concrete, it merely means that any new material or type of construction goes through its period of evolution.

A. C. TOZZER—The fire-resisting quality of concrete calls for special emphasis, said A. C. Tozzer (Turner Construction Co.). In the burning of the Edison plant, 13 or 14 years ago, timber buildings were destroyed, steel members survived, but were distorted out of shape, while concrete buildings were only spalled (except for mechanical injury by the collapse of a water tank) and were repaired and back in use in six weeks. Since it is imperative to fireproof a steel frame, why not use the fireproofing concrete with steel rods replacing the structural sections and save cost and time?

W. A. BRYANT—In fire and load tests of columns at the Underwriters' Laboratories some years ago, W. A. Bryant said, no single concrete column failed under its designed load in 8 hr., while steel columns required at least 4 in. of concrete protection to enable them to remain in service.

GEORGE F. SWAIN (closure)—None of the facts or arguments advanced in the paper are disturbed in the least by the discussion. If concrete buildings have stood up, it does not prove that the same buildings in steel would not have stood. The age of structural steel began only about 1890, while that of concrete goes back to 1824 (Aspdin, portland cement) or at any rate to the 50's (Monier's flower pots and boat). Even Ransome's California work antedated structural steel.

The extended use of concrete does not prove the desirability of the material; compare the popular sentiment for canals a hundred years ago, or the Canadian enthusiasm for railway construction 20 years ago, as well as the present enthusiasm in certain regions for the Chicago-to-Gulf waterway.

The paper was devoted not to characteristics of structures, but only to characteristics of the material. Professor Swain said, and he intimated that he might write another paper discussing steel and concrete in the finished struc-

tures, contrasting the shimming of columns and mismatching of rivet holes with the faults in concrete building work; and perhaps still another paper, on accepted theories of reinforced concrete and what he thinks of them.

He expressed doubt as to the practicability of producing impervious and non-permeable concrete. He emphasized the importance of time effects in concrete, and asked whether the Portland Cement Association has published anything on this subject.

In conclusion Professor Swain expressed the belief that his paper will make people think and put a little brake on the enthusiasm with which concrete is regarded.—*Engineering News-Record*.

GREAT GRANDPA DEPENDED ON CHIMNEY FOR VENTILATION

Used Smoke Outlet for Changing Air in Home—Control Secret of Electrical Weather Making

Great, great grandpa didn't know much about the various elements that make weather or climate and he may have been somewhat superstitious about the part that systematic ventilation played in public health but he did use his chimney as a natural draft for ventilating his home. W. A. Rowe, ventilation expert, declared in an address here.

Although most people use chimneys to carry out smoke and while it was considered important during the annual visits of old St. Nick, the first chimney wasn't invented until 500 years ago, Mr. Rowe said. What people did before that for ventilation in cold weather, besides opening doors and windows, Mr. Rowe didn't mention.

It has been the rapid development of the electric, steam and water power industries that has been an important factor in advancing the science of mechanical ventilation which gives positive and perfect control of air conditions, he added. The engineers now hook up electrical machinery to manufacture any kind of weather condition desired in any building, regardless of what the weather is outside, he said.

Declaring that ventilation has been placed more than ever on a qualitative basis and that this is increasing the productivity of labor in various industries, Mr. Rowe continued:

"Control is the secret of electrical ventilation. The first step is control of temperature; the second, control of air changes; third, control of relative humidity; fourth, control of cleanliness; and finally, control of air movement. To attempt proper control by the individual would be impractical, unsatisfactory and expensive.

"In the beginning, ventilation was largely a question of temperature and air change. It was soon evident that the control of the temperature as indicated

on a dry bulb thermometer was not entirely the correct index of one's comfort or sensation of warmth. Another factor became apparent, namely, the moisture content of the air. As the wet bulb thermometer has for years been the means of determining the relative humidity, or moisture content of the air, it was for a while believed that the human body was responsive to temperatures as registered on the wet bulb thermometer.

"Recent research work has shown that neither of these are correct and that the sensible temperature is based on not only dry bulb temperature and moisture content, or relative humidity, but also on air movement and the sensible temperature comes somewhere between the temperatures as registered on the dry and wet bulb thermometers.

"There are other factors, such as cleanliness and absence of odors, that should be considered. It is quite generally recognized that bacteria and germs would be absent from the air if there were not dust particles to which they could become attached. Dust has other well understood physiological effects on the mucous membrane which makes cleanliness of prime importance. On the economic side is the savings which can be effected by dust elimination. For example, department stores can reduce materially the loss due to soiled goods. It is almost imperative in libraries, if rapid deterioration of manuscript is to be avoided. It is of tremendous importance in many industrial processes.

"What is the ideal climatic condition for any building or home? For people normally clothed and slightly active, in still air, the most favorable temperature conditions are 68 degrees Fahrenheit on the dry bulb and 58 degrees, wet bulb temperature. This corresponds to a relative humidity of approximately 55 per cent. Where there is slight air movement, the sensible temperature is somewhat lower than this, depending upon the air velocity."

The Fortieth Annual Banquet of the Philadelphia Builders' Exchange and Employers' Association will be held Thursday evening, February 17th, at seven o'clock in the Manufacturers' Club. Speakers will be the Rev. Samuel Steinmetz, Trenton, N. J., the Hon. J. Hampton Moore, Ex-Mayor of Philadelphia, and Rabbi Wm. H. Fineshriber, Philadelphia.

The Entertainment Committee is composed of O. W. Ketcham, Chairman, Thomas F. Armstrong, S. French Reeves, Charles P. Biggin, W. F. Sullivan.

In the 1927 Directory of the Architectural and Building Trades under classification of Architects, Page 5, Wassermann, Samuel, should be changed to Wasserman, Simon.

"ANTI-HYDRO" Keeps the Concrete Pits Dry in this "Spearmint" Factory

The concrete pits in this new Wrigley plant are permanently waterproofed with "ANTI-HYDRO," and as a result, they are always dry.

A one-inch cement plaster coat mixed with "ANTI-HYDRO" when applied on the inside of pits, walls and foundations keeps them absolutely dry against any head of water.

"ANTI-HYDRO" is extremely easy and economical to use. It is a liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. It accelerates the set of cement and so enriches the concrete that the finishers' time is reduced to a minimum.

For 22 years "ANTI-HYDRO" has proved its economy and satisfaction on every type of concrete hardening and waterproofing work. Use it on your next job.

As The Editor Sees It

STATEMENT BY COMMITTEE APPOINTED TO SURVEY THE GENERAL CONDITION OF THE FIRST MORTGAGE REAL ESTATE BOND BUSINESS

At a meeting called last November in New York City by the American Construction Council, and attended by a large number of bankers, contractors, architects, accountants and representatives of investment banking and first mortgage real estate bond houses, the American Construction Council was asked by resolution to appoint a Committee of seven representatives of the first mortgage real estate bond houses, of which Committee Mr. Franklin D. Roosevelt, President of the Council, was to be chairman "to survey the general condition of the real estate bond business and to co-operate in such survey with the Committee of the Securities Commissioners of the several states, with power to add to its membership and to appoint sub-committees and to report at a subsequent meeting of this body at the call of the Chair."

Pursuant to the foregoing resolution Mr. Roosevelt appointed the following Committee:

Edgar N. Greenebaum, Greenebaum Sons Investment Co., Chicago, Ill.
William J. Moore, American Bond & Mortgage Co., New York City.
Alfred J. Murphy, Federal Bond & Mortgage Co., Detroit, Mich.
G. Bryan Pitts, The F. H. Smith Co., Washington, D. C.
Edward Sonnenschein, Chicago Mortgage Bankers' Assn., Chicago, Ill.
S. W. Strauss, S. W. Strauss & Co., New York City.
J. M. Ulmer, Mortgage Banker' Assn. of Ohio, Cleveland, Ohio.

This Committee has since then been in almost continuous session, and a full and frank discussion of the methods of this very large and important part of the financial and building structure of the country has been had. The Committee has examined, so far as possible, into every phase of the transactions of purchase, construction, interest and amortization. The Committee has also had the advantage of frequent consultation with Mr. A. J. Maxwell, President of the National Association of Securities Commissioners, popularly known as the "Blue Sky Commissioners," and with the Com-

mittee on Real Estate Mortgage Bonds of that Association, consisting of Messrs. David H. Jennings, Indianapolis, Ind., Hezekiah N. Duff, Lansing, Mich., Keyes Winter, Deputy Attorney General of New York State, and R. E. McNellis, Nashville, Tenn., and with the counsel for that Committee, Maurice L. Mendenhall, Indianapolis, Ind.

The Committee is not yet ready to make a final report, but does believe that the public should now be informed that on January 21st, at a meeting in Chicago, representatives of six large bond houses entered into an agreement adopting certain principles or canons of procedure. This agreement was signed by Greenebaum Sons Investment Co., of Chicago, American Bond & Mortgage Co., of Chicago, The F. H. Smith Co., of Washington, D. C., Federal Bond & Mortgage Co., of Detroit, and S. Ulmer & Sons, Inc., of Cleveland. It was stated in writing by S. W. Straus & Co. that it would comply with the requirements of the agreement, declaring further its adherence to its own practice, providing that it be simply in addition to and not in diminution of said requirements. All of

the Committee of the National Association of Securities Commissioners, referred to above, except Mr. Keyes Winter, Deputy Attorney General of New York State, gave their approval in writing to the draft of principles or canons of conduct; Mr. Keyes Winter stated that those portions of the agreement over which he had jurisdiction were satisfactory to him in so far as they conform to the principles of absolute separation of trust accounts from the risks of the business and of notice to bondholders of defaults.

The agreement is as follows:

We, the undersigned, first mortgage real estate bond houses, recognize as essential for the proper conduct of the business in which we are engaged, certain principles which will insure the financial stability and correct economic conduct of houses of original issue selling such issues principally at retail directly to the investor, and do hereby adopt and subscribe to the following business principles as accomplishing that end:

Duties of Houses of Issue

All first mortgage real estate bonds that shall be sold by the house shall be safe and conservative investments.

It shall be the duty of each house:

(a) To provide and maintain funds necessary for, and to make, all payments in connection with the construction project in accordance with the terms of the underwriting agreement.

(b) To check and supervise construction in order to procure substantial compliance with the plans and specifications.

(c) To guarantee to the bondholders completion of the building free and clear of prior liens, such guarantee to be fulfilled at the option of the house of issue, either by completion of the building or by the repurchase of the bonds at the original purchase price and accrued interest.

It shall be the continuing duty of each house:

(d) To check and enforce the proper physical maintenance of the security after completion.

(e) To check and enforce maintenance of insurance.

(f) To check and enforce payment of all taxes and assessments when due.

(g) To check and enforce compliance by the borrower with requirements of all laws and ordinances and other governmental regulations.

(h) To provide for the collection of principal interest and income tax payments from the borrower, and to provide adequate facilities for payment of same

to the holders of securities as and when the same are due.

Trustee

For the purpose of carrying out the foregoing and other duties, the house of issue shall either act as trustee or provide a trustee to take title under the indenture. Where the trustee is not a bank or trust company under public supervision, the trustee shall be an officer or director of the house of issue and where the trustee is not an independent bank or trust company under public supervision the house of issue shall be fully responsible for all acts of omission or commission by the trustee to the same extent as if the house of issue were itself the trustee. The assumption of such responsibility by the house of issue shall be authorized by proper resolution adopted by the house of issue set forth in its minutes, and by such other formal instruments of assumption as may be requisite. The appointment of an officer or director of the house of issue shall not preclude the appointment of an additional trustee, but the appointment of such additional trustee shall not in any event relieve the house of issue of its responsibility. In any event where the house of issue or any of its officers or principal stockholders has any interest in the equity, the trustee and/or the additional trustee shall be an independent trustee.

Advances of Money by House of Issue

The Trust Deed shall provide that when the house of issue advances funds for principal and/or interest, it shall be the duty of the house of issue, to pursue one of the following causes within ninety days after the maturity of such principal and/or interest payments:

(a) To subordinate such bonds and/or coupons to all unmatured bonds or coupons of the same issue; such subordination to be by physical endorsement on the bonds and by appropriate action with respect to the coupons.

(b) To notify the trustee and all holders of bonds of the same issue that funds were advanced by the house of issue and that it intends to hold all such bonds and/or coupons, on a parity with the balance of the issue.

If the notice provided for in paragraph (b) shall not have been given, the subordination shall be automatic. Advances made by the house of issue for any payments due by the borrower shall hereafter be made only from the capital and surplus account of the house of issue.

Irrespective of subordination where

Brick, steel, fireproof, 3 or 6 stories, 30x100 feet, slag roof, oak, pine and composition floors, linoleum floors, vapor heat, metal lath, electric light, tile work, fire doors, iron stairs, ornamental iron. Plans in progress.

Auto Bridge, Longport to Ocean City, N. J. Owners, Company, care of Postmaster E. J. Sutton, Ocean City. Bascula withdraw, with 100 feet clearance between piers and vertical clearance. Preliminary plans in progress.

Church, Audubon, N. J. Architect, private plans. Owners, Holy Trinity Lutheran Church, Rev. J. D. Krout, Audubon, N. J. Plans drawn. Work contemplated.

Department Store, Starr and Entrance Road, Camden, N. J., \$750,000. Architects, George C. Nimmons Co., 122 South Michigan Boulevard, Chicago, Ill. Owners, Sears-Roebuck Co., Mr. L. J. Rosenwold, Boulevard, Philadelphia. Brick, reinforced concrete, limestone, steel, 2 stories (plumbing, heating, lighting and elevator reserved), rubber tile, maple and cement floors, slag roof, safety treads, integral waterproofing, metal lath, tile, marble and terrazzo work, rolled steel sash and skylights, kalamein doors, iron stairs, caisson. Plans in progress. Will be ready for general bids late in March.

School, Woodlynne, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owners, Woodlynne School Board, A. Cox, secretary, care of architect. Brick, steel, 2 stories, 38x72 feet, slag roof, maple floors, safety treads, roof ventilators (heating, plumbing and electric separate), fireproof doors. Plans in progress. Plans will be ready for bidders February 23rd.

Street Paving, Merchantville, N. J. Engineers, Remington & Vosbury, 509 Cooper street, Camden, N. J. Owners, Borough of Merchantville, Borough Council. Merchantville, N. J. Lowest bidders: Fish-Rutherford Co., 4058 Chestnut street, Philadelphia, \$55,804.50.

Apartment House, Moving Picture Theatre and Stores, Absecon, N. J. Architect, Thomas Stephen, Temple Building, Camden, N. J. Owner, T. M. Carter, Absecon, N. J. Con-

crete, steel, stucco, 2 stories, 122x79 feet, slag roof, pine and terrazzo floors, metal ceilings, iron stairs, fire doors, plate glass, tile work, steam heat, electric light. Owner will build.

Building (alts. and add.), 1741 Boardwalk, Atlantic City, N. J. Architects, Silverman & Levy, Elrae Building, Philadelphia. Owners, Brunswick, Balke & Callender Co., Atlantic City, N. J. Architects taking bids February 17th.

Grading and Fill, Crescent Boulevard, Collingswood and Big Timber Creek, N. J. Owners, State Highway Department, Trenton, N. J. Owners taking bids due February 28th, 140,158 cubic yards excavation, 663,000 cubic yards fill.

Sewage Disposal Project, Barrington, N. J., \$300,000. Borough engineers, Albertson & Hammond, Barrington, N. J. Owners, Borough of Barrington, Borough Hall, Barrington, N. J. Includes pipe, installation, sewage disposal plant, etc. Tentative plans drawn. Work approved.

New Jersey Contracts Awarded

Buildings, North Jersey Training School for Feeble Minded, Totowa, N. J. Architects, Division of Architecture and Construction, Trenton, N. J. Owners, Department of Institutions and Agencies, Trenton, N. J. Contracts awarded: Dining Hall and Kitchen—Bowe & Millmet, Union City, N. J., \$102,400; plumbing, George J. Tobin, Plainfield, N. J., \$23,985; heating, George J. Tobin, Plainfield, N. J., \$9,355; electric, Fischbach & Moore, 222 East Forty-second street, New York, \$4,446. Vocational, Industrial and School Building—C. J. Smith Const. Co., 202 Academy street, Trenton, N. J., \$113,626; plumbing, J. T. Evans, Wilkes-Barre, Pa., \$10,131.67; heating, George J. Tobin, Plainfield, N. J., \$9,981; electric, K. W. Electric Co., 47 Lawrence street, Newark, N. J., \$7,173. Recreation and Assembly Building—F. & C. Haerter, West New York, N. J., \$111,640; plumbing, George J. Tobin, Plainfield, N. J., \$6,498; heating, George J. Tobin, Plainfield, N. J., \$7,963; electric, Hoffman & Elias, 59 East Fifty-first street, New York, \$9,396. Laundry—C. J. Smith Const. Co., 202 Academy street, Trenton, N. J., \$24,850; plumbing, George J. Tobin, Plainfield, N. J., \$2,435; heating, George J. Tobin, Plainfield, N. J., \$2,971; electric, Hoffman & Elias, 59 East Fifty-first street, New York, \$1,818. Power House—Edward M. Waldron, Inc., 27 Central avenue, Newark, N. J., \$48,278; plumbing, George J. Tobin, Plainfield, N. J., \$1,689; electric, K. W. Electric Co., 47 Lawrence street, Newark, \$19,913; coal handling, J. H. Cooney, Harrison, N. J., \$29,940. Radial brick Chimney—Rust Eng. Co., Pittsburgh, Pa., \$8,500. Elevators, Otis Elevator Co., Otis Building, Philadelphia. \$2,860.

Residences, 7904 Atlantic avenue, Margate City, N. J. Architect, J. R. Ogden, 143 South South Carolina avenue, Atlantic City, N. J. Owner, Mrs. Ida Van Valkenburg, care of architect. Frame, 2 stories, 26x42 feet, slate roof, hardwood floors, tile work, electric light. Contract awarded to J. L. Stone, 112 New Haven avenue, Ventnor, N. J.

Building (add. and alts.), 520 Federal street, Camden, N. J., \$3,600. Architect, A. B.

**GENERAL
INSURANCE**

Gill, 328 Market street, Camden, N. J. Owner, William Plevinsky, 520 Federal street, Camden, N. J. Brick, 1 story add., 4x14 feet, new store front, tin roof, general alterations. Contract awarded to S. Levy, 1214 Kaighn avenue, Camden, N. J.

Residence, 1036 North Thirty-fifth street, Camden, N. J., \$3,600. Owner, John Kane, 1036 North Thirty-sixth street, Camden, N. J. Frame, 1½ stories, 24x34 feet, slate surface roof, hot air heat. Contract awarded to Allen & Renner, 2721 Lincoln avenue, Camden, N. J.

Elevators, Seventh and Linden streets, Camden, N. J. Architects, The Ballinger Co., Twelfth and Chestnut streets, Philadelphia. Owners, Camden Bridge Garage, on premises. Contract awarded Otis Elevator Co., Otis Building, Philadelphia.

Residence, Haddon Heights, N. J. Architects, Lackey & Hettel, 5 Hudson avenue, Camden, N. J. Owner, J. V. Moran, Haddon Heights, N. J. Stucco, 2½ stories, 30x40 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded to J. Strang, Haddon Heights, N. J.

Miscellaneous Construction News

Plant (add.), Wilmington, Del., \$38,650. Engineers, Kiebetz & Koenig, Emerson Tower Building, Baltimore, Md. Owners, Wiltex Co., 10 East Twenty-second street, Wilmington, Del. Brick, concrete, steel, 1 story and basement, 214 feet 4 inches x 86 feet, saw tooth roof, concrete and wood floors, roof ventilators, heating extension, electric light, metal lath, steel sash and skylights, fire doors. Plans in progress. Will take new bids in spring.

Residence and Garage, Strafford and Buena Vista avenue, Winston-Salem, N. C. Architect, Charles Barton Keen, 338 South Smedley street, Philadelphia. Owner, R. D. Shore, Winston-Salem, N. C. Hollow tile, stucco, 2½ stories and basement, 130x45 feet, tile roof, oak and pine floors, metal lath, tile work, bond, ornamental iron. Architect taking bids due February 19th.

Miscellaneous Contracts Awarded

Laundry, Garage and Central Heating Plant, Frederick, Md. Architect, J. B. Hamme, City Bank Building, York, Pa. Owners, Hood College, Dr. J. H. Apple, Frederick, Md. Fireproof, 1 story, 55x140 feet, composition roof, concrete floors, gypsum block, roof ventilators, cast stone, tile work, fire doors, steel sash and skylights, electric light. Contract awarded to H. C. Culler, Frederick, Md.

Residence, Louisville, Ky. Architect, C. A. Ziegler, 1012 Walnut street, Philadelphia. Owner, Dr. J. H. Simpson, Louisville, Ky. Frame, 2½ stories, 35x80 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Contract awarded Palmer Graham, Louisville, Ky.

Raynor's Plasterers' Safety Clips for securing metal lath to furring bars are gaining popularity daily. On the new Provident Life & Trust Company's new office building, at Seventeenth and Chestnut streets, Philadelphia, these clips were specified by Rankin & Kellogg, Philadelphia Architects.

Alvin C. Bieber, Architect, has opened new offices at 1520 Locust street, Philadelphia. Kindly send all catalogues to this address.

(Continued from page 100)

the borrower fails for a period of eighteen consecutive months to pay at least one-third of the aggregate of principal and interest payments maturing during such period, the house of issue shall notify all holders of the bonds of the same issue of the default.

Appraisals

In order to assure conservative and sound appraisals and to facilitate their analysis, the house of issue shall provide and be prepared to furnish as required, an appraisal setting forth in detail all items upon which it is predicated, and the specific amounts or percentages allocated to each item, together with the names and qualifications of the appraisers. The publishing or furnishing of appraisals shall mean that in the judgment of the house of issue, based upon its own investigation, such appraisals are reasonable and sound. Irrespective of the value of the security as determined by appraisals, the borrower in every issue should be required to have a substantial investment in the project. Efforts shall be immediately initiated to secure a uniform basis of appraisals.

Circulars

Circulars should contain adequate information on the following points:

1. Location and description of security.
2. Ownership of property.
3. Name and identity of trustee.
4. Valuation of land or leasehold.
Valuation of buildings.
Name of appraisers.
5. Earnings (gross and net), whether actual or estimated.
6. Purpose of issue.
7. Amount of issue.
Interest rate.
Principal payments.
8. Provisions for and place of collection and distribution of principal, interest and income tax payments.
9. Guarantee of house of issue to bondholders, of completion of building, free and clear of prior liens, with right to discharge such liability at the option of the house of issue by the repurchase of the bonds at the original purchase price and accrued interest.
10. Full disclosure of any interest, direct or indirect, of house of issue or its officers or principal stockholders in the security other than as the house of issue.

Interim Receipts

Sales of securities before the permanent bonds are available, should be either through the sale of temporary bonds executed by the mortgagor, or interim receipts in which the trustee shall join as a party, and which shall certify that there

has been delivered to the trustee a temporary bond which is held by the trustee for the benefit of the holders of interim receipts to the extent of their respective holdings.

Accounts

Each house of issue shall maintain a construction liability account, an interest and amortization account, and a capital account.

The construction liability account shall consist of all of the liabilities of the house of issue to borrowers on construction issues. The house of issue shall at all times have assets consisting of cash, governmental securities, assets convertible into cash within forty-eight hours, or bonds secured by uncompleted or completed buildings, or loans fully collateralized by such bonds, at least to the amount of the total liabilities in said construction liability account; provided, however, that none of the aggregate of said bonds shall be composed of bonds maturing in more than one year, which have been repurchased by the house of issue at the request of the holders thereof.

The interest and amortization account shall hereafter be carried as a separate trust account and shall consist of all of the liabilities for principal, interest and tax payments paid by borrowers to the house of issue before payment thereof to the holders of bonds. The house of issue shall at all times have assets consisting of cash, governmental securities, or other assets convertible into cash within forty-eight hours, at least to the amount of the total liabilities in said interest and amortization account.

Withdrawals of cash from either the construction liability account or the interest and amortization account shall be only to make payments for liabilities included in said accounts, or for the purchase of assets of the kind and character provided for in said respective accounts.

Solvency and Liquidity

The solvency and liquidity of the house of issue enabling it to promptly meet all obligations at maturity, shall be maintained at all times.

1. By the house of issue having on hand at all times assets consisting of cash, governmental securities, or other assets convertible into cash within forty-eight hours, in an amount in excess of all liabilities which will reasonably mature within thirty days, with the right to credit against the amount of such liabilities, an amount equal to one-half of the cash sales of the house of issue for the preceding thirty day period; but in no event shall the credit for such cash sales exceed two-thirds of the amount of the liabilities maturing within the following thirty days.

2. By having on hand assets in addition to those required under the provisions of section 1, which can reasonably under

ordinary business conditions, be converted into cash within sixty days to an amount equal to at least 33 1/3% of all liabilities beyond those maturing in the ensuing thirty days, and other than capital and fully collateralized liabilities.

3. To maintain assets not in default and not frozen at least to the amount of all liabilities other than those named in provisions No. 1 and No. 2 and other than capital and fully collateralized liabilities.

Correct statements of financial condition, properly verified by independent, certified or public accountants, shall be regularly forwarded to the authorities of the various states having jurisdiction or supervision of the houses of issue or of the securities issued by them. The accuracy of the statements submitted as well as the general condition of the houses of issue should at all times be subject to inspection by the properly constituted authorities of the various states.

Effective Date

The above provisions shall become effective as to each house of issue subscribing hereto not later than ninety days after such signature, and shall refer only to issues made or purchased by the houses of issue thereafter and shall not be retroactive as to any issues made prior thereto, provided that the accounts above mentioned shall be set up as much prior to said ninety days as practicable.

* * *

We reiterate our belief and conviction that adherence to the foregoing business principles will insure the stability and integrity of our business, and enable us to function as a distinct and independent unit in the investment field, rendering effective and valuable aid in the development of the economic structure of the country.

Subscribed to by the following houses of issue at the dates set opposite their names:

Greenebaum Sons Investment Co., by Edgar N. Greenebaum, Vice Pres. Dated January 21, 1927.

American Bond & Mortgage Co., by William J. Moore, President. Dated January 21, 1927.

The F. H. Smith Company, by G. Bryan Pitts, Chairman of Board. Dated January 21, 1927.

Federal Bond and Mortgage Company, by Alfred J. Murphy, President. Dated January 21, 1927.

S. Ulmer & Sons, Inc., by J. M. Ulmer, Treasurer. Dated January 21, 1927.

The foregoing draft of principles and provisions for the conduct of the first mortgage real estate and bond business is hereby approved by the Committee of the National Association of Securities Commissioners. January 21, 1927.

David H. Jennings, Chairman; Hezekiah N. Duff, R. E. McNellis.

The Committee unanimously feels that this agreement is a long step in the right direction in an industry which during the year 1926 sold approximately a billion dollars of first mortgage real estate bonds to the public and which has been responsible for the construction of many needed buildings and for replacing obsolete structures.

Mr. Roosevelt, Chairman of the Committee, personally believes that before the Committee makes its final report further steps should be taken, but is of the opinion that the results obtained from the present agreement made by certain bond houses with the Committee of the National Association of Securities Commissioners will furnish a better basis of determining what those steps should be and how far they should go.

In view of the Chicago agreement, the Committee has adjourned to await the result of the present steps and to confer later to consider those results and other matters not yet disposed of by the Committee. In the meantime a sub-committee has been appointed to consider uniformity in appraisals.

MAXIMUM VALUE FROM YOUR BUILDING DOLLAR

1. The Gains from Standardization

BY WILLIAM DALTON

General Electric Company

As told to ARTHUR VAN VLISSINGEN, JR. "Reprinted by Special Permission from Factory, the Magazine of Management"

"How does General Electric get so much for its money when it builds?" Industrial executives who have been asking this question—of themselves and others—will find the answer in this interesting series of five articles of which this is the first.

In planning a building for General Electric, one aim is kept constantly in mind: A building must be a satisfactory working unit and a comfortable housing for the people who have to work in it. These considerations outweigh the desirability of getting it put up at the minimum cost.

Naturally our purpose is to get a building measuring up to our requirements at a cost no higher than is absolutely necessary. The point is, however, that we plan the plant up to our standards rather than down to a price.

Experience has demonstrated that without question this is the profitable policy in construction. Perhaps there have been times in the past when it was good business to go about building with a different set of aims. Conceivably there may be such a time in the future. But at this time, the plant engineer who sets out to get anything but a first-class building is

going absolutely contrary to the General Electric conception of what constitutes sound policy.

For building costs are high today, in comparison with not so many years ago. There is no immediate prospect of their going materially lower.* And the one way to make sure that a construction project will turn out a profit maker in the long pull is to erect the plant so that it will serve well and last long. It cannot make money for the owner otherwise.

We hold before our eyes the reminder that unless a plant will last at least 50 years as an efficient production unit, then it has no business to be built. For the interest charges against a building are not materially increased if it is built well but with care to hold the cost down. And depreciation charges are decreased tremendously. Goods turned out in a 50-year factory do not cost as much as those produced in a plant built to last 20 years. That is just plain common sense.

But 50-year building makes mandatory another consideration: It must be a general-purpose building, rather than a single-purpose plant. In that span of years, it is almost certain that the product manufactured in a given factory will have changed almost completely at least once and probably many times.

Take, for example, the plant which has been going up at the rate of several buildings a year at West Philadelphia, our Elmwood Avenue Works. It is used entirely for making switches and switchboards, not the small stuff used in homes, but the larger units for industrial and central station purposes.

Some of this is fairly heavy manufacturing. Some of it, again, is reasonably light. But there is no reason why that plant might not be converted, at no more expense than the cost of changing machinery, to the manufacture of anything of moderate size in the General Electric line. Or for that matter, it would serve just as well in the manufacture of foodstuffs, or in woodworking, or in any other type of production which will go in the space available and which is not essentially a single-story operation (for these are multi-story buildings). What is more, it would be an efficient and not expensive plant for any of these purposes.

In this group of multi-story buildings, served by switch-tracks, each floor of each building is an open space unbroken except for the two rows of columns running the long way of the building. The typical units of this plant are built in 80-foot widths each, and each divided into 3 bays which run the full length of the building. Each bay is served by an overhead crane.

*See Cost of Building Chart, page 138, January, 1927, *Factory*.

"Service Towers" Give Unbroken Working Space

The unbroken working space is made possible by the use of our "service towers." These towers are simply parts of the regular factory buildings, the same height as the main buildings but separated from the working spaces by full walls. In the towers are all of the service features, all of the functions which do not classify unqualifiedly as production. Elevators, for instance, are all in tower space. So are stairways, and toilets, and everything of the sort. Water tanks surmount towers, so that sprinkler piping can come down in tower space instead of production space. The towers are the catch-alls for everything which, if located inside the main buildings, would cut into the unbroken working space.

Philadelphia has a fire law which provides that stairways must be in towers outside the main structure of the factory, and that these stairways must be open to the air, at least to the extent of unglazed window openings. This is, of course, a safeguard against fire and smoke while the employees make their way to safety in the event of a serious fire. But it is an operating nuisance, in that the employee using an open stairway in cold weather is exposed to extremes of temperature which are not only unpleasant but also dangerous. It is all right, of course, for the worker wearing a hat and overcoat, on the way home from work. But the man with a hurry-up errand who walks down from the fifth floor, where he has been working in a warm room, to the equally warm fourth, may be badly chilled on the stairs.

We have used a design which permits us to sandwich two flights of stairs into a tower, without taking up much more space than a single flight would. One of these flights complies explicitly with the fire law. The other is entirely enclosed. The open stair is slightly less accessible from the working floor, while the enclosed stair opens right out of the departments. Employees therefore use the enclosed stair for all ordinary purposes, remaining indoors comfortably. But the fire stair is right at hand, meeting the requirements of the ordinance and providing safe egress in case of fire.

Careful planning, standardization in every respect where it is desirable, and the most careful scrutiny of every detail about a prospective building make it possible for the General Electric Company to obtain the maximum value for every building dollar spent. We have standardized, for instance, on 17-foot floor to floor measurements throughout. This height permits the use of cranes. It admits a maximum of daylight, so that it is possible to work by daylight on a reasonably clear day even in the middle bay of a building 80 feet wide. And it

permits ample head room for mezzanines if they are needed.

Floor Covering a Part of Building Cost

Likewise we have standardized on putting into our buildings a floor covering, which we consider part of the building cost. For manufacturing departments we ordinarily use woodblock floor covering over the concrete.

Experience has taught us a worthwhile trick about laying linoleum, which is our standard floor-covering for office departments and the like. We leave the concrete floor uncovered for between six and nine months. Then, when the concrete has had ample time to dry out thoroughly, we put down the linoleum. Laying linoleum on new concrete frequently results in blistering, since the moisture works up out of the concrete and makes bad blisters because it cannot get through. Since we adopted the policy of waiting to lay the linoleum, we have had no trouble whatever with blistering linoleum.

We standardize in respects such as these, and in important procedures as regards the structural details of the building. But we are never so completely sold on a standard that we will not cheerfully scrap it and substitute another the minute we see an advantage in so doing. To refer once more to the West Philadelphia plant, the details of each building vary considerably from those of the earlier buildings on this same plant. The first buildings here were erected in 1924. As this is written, one of the largest units of the plant is being built. And the difference between certain of the refinements of detail in Building 6 and Building 10 is very noticeable.

For we are constantly experimenting on every important point which we have reason to believe we can improve. As soon as we have an improvement perfected, that becomes our new standard.

Standardization in building by no means should be interpreted as holding doggedly to any standard which can be raised. Experimenting takes time and costs money, to be sure. But if it is intelligently done it brings returns considerably greater than the cost. And standardization in a given respect—whether as to a type of construction to be followed, or a wall finish, has the advantage that it removes that point from the field of discussion until next time an improvement is suggested.

ORNAMENTAL STREET LIGHTING

The Murlin Mfg. Co., of 5420 Paschall Ave., Philadelphia, Pa., has been developing for the past two years a line of cast iron ornamental street lighting which fits in very naturally with their line of cast ornamental exterior lighting for homes, apartments, schools, hotels, factories, bridges, driveways, etc. The natural

development of this department has come with a number of street lighting contracts completely laid out and all specifications made by the engineers of this company. Some of these contracts have been successfully completed by contractors and others are now in the course of construction.

A fully equipped engineering department has been developed to promote the interest of cities as well as developers as it must be realized that the proper placing of street lighting units is essential not only with regards to the proper lighting but to the economy as well. The Murlin Mfg. Co. engineering department lays out street lighting systems including service poles, trenches, lighting units and will be glad to figure the approximate cost of complete erection when a plan of a city or development is presented, but only figure on furnishing cast iron posts.

The use of cast iron as a substantial post has been proven and in the construction of cast iron posts by this company all elements have been given consideration. It is a known fact that each day with the rising and setting of the sun there is internal sweating due to the difference in temperature which is a factor of corrosion to be considered. In addition to this there is frost, rain, snow and the other weather elements to be given consideration. A substantial cast iron post if properly weather-proofed will resist these elements practically indefinite.

The posts manufactured by this company are made in three parts, namely: the base, shaft and head. These different parts are all machined which means that they will stand positively straight.

By making them in three parts in case of any breakage any one part can be replaced as all parts are interchangeable and this will mean a distinct saving to the customer.

Posts made from cast iron will not bend or break from a slight knock due to the rigid construction.

Standards manufactured by this company are equipped to take any voltage, transformers, pot heads or any material used in the erection of standards.

The Murlin Mfg Co. is now in a position to serve the trade along these lines with standards and the proper engineering information.

The Murlin Manufacturing Company, 54th and Paschall Avenue, Philadelphia, has just issued a catalogue illustrating a line of solid cast bronze exterior fixtures and showing list prices on all fixtures manufactured by them at the present time in iron and in cast bronze. A section of the catalogue devoted to street lighting is very instructive and should be of valuable service to Architects, Engineers, and Contractors. Copy on request.

"ANTI-HYDRO" Keeps the Concrete Pits Dry in this "Spearmint" Factory

The concrete pits in this new Wrigley plant are permanently waterproofed with "ANTI-HYDRO," and as a result, they are always dry.

A one-inch cement plaster coat mixed with "ANTI-HYDRO" when applied on the inside of pits, walls and foundations keeps them absolutely dry against any head of water.

"ANTI-HYDRO" is extremely easy and economical to use. It is a liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. It accelerates the set of cement and so enriches the concrete that the finishers' time is reduced to a minimum.

For 22 years "ANTI-HYDRO" has proved its economy and satisfaction on every type of concrete hardening and waterproofing work. Use it on your next job.

As The Editor Sees It

THE WORKERS IN THE BUILDING INDUSTRY ARE INTERESTED IN SAFETY

BY ELMER SPAHR

*President, Pennsylvania State Conference
of the Bricklayers, Masons, and
Plasterers International
Union*

The fact that there has been a great increase in both fatal and non-fatal accidents in Building and Construction, while other industries have shown a decrease in accidents during the past year, might lead to the belief that the workers in the building trades were indifferent to safety and accident prevention. The very opposite is true. For many reasons the worker on building construction is very much concerned about preserving his life and keeping his limbs in good working order, for in no other line of employment is there so little use for a crippled or maimed employe. Then, too, there is always the physical pain and anguish accompanying an accident besides the financial loss to the worker, especially if he is a skilled mechanic.

The pittance provided for in our Workmen's Compensation Act is certainly no inducement for any one in the building trades to get into an accident and

take a vacation on his employer's compensation.

However, there are many reasons for this increase in accidents in building and construction, most of which are without justification; and the drive that is now being put on by the Department of Labor and Industry in this particular field of endeavor will disclose many flagrant violations of the State Regulations for Scaffolds as drawn by the Industrial Board of the Department of Labor and Industry.

The large majority of employers as well as employees do not know that there is such a thing as State Regulations for Scaffolds for their guidance in safe practice, which have been carefully worked out by a committee, composed of contractors, safety engineers and representatives of the workers in the various trades, which were adopted by the Industrial Board after a number of meetings in Philadelphia and Pittsburgh. A greater distribution of this booklet, "Regulations for Scaffolds" and compliance with its provisions would greatly reduce the accidents in this industry.

A great many new workers have entered into this kind of employment. In the trowel trades alone there has been

an increase of fifty per cent. in the last three years, and an influx of new workers always brings its additional quota of accidents.

The fact that 75 per cent. of the labor in the Construction Industry is performed on temporary flooring or scaffolding, makes for numerous accidents. Many of these temporary scaffolds are constructed with the thought of easy demolition and removal after they have served their purpose rather than the thought that they shall be substantial enough to carry their load of material and workmen.

On many small operations lumber is used that is absolutely unsuitable for scaffolds. Present-day lumber that is used for roof sheeting or sub-floors is not strong enough for bricklayers' or masons' scaffolds. But to save costs of drayage and lumber, this sheeting is very often used.

The use of elevators and material hoists of various types has also added to hazards and accident lists. In many instances the means provided to get from one floor to another virtually compels the worker to use the material elevator, even though it is contrary to law, and the elevator is so posted. Where there is no stairway, ladders should be placed

in such a manner, and be of such construction as to invite their use, so that the workman will not take a chance on a material hoist.

Many modern buildings have numerous openings in the floors for stairways, elevators, pipe shafts, and other uses. Few of these have guard rails, and when workmen remove the covers, few take the time to replace them.

Upturned nails in lumber stripped from concrete is another source of dangerous accident. No one seems to pay any particular attention to this menace until some one is injured, and then a general clean up is started.

A good, safe scaffold is a profitable investment and should be considered as such, for no man can render his best service when he must continually watch his footing and have his mind occupied with the defects of a poorly constructed scaffold instead of with the work he is performing.

The workers on building construction are interested in safety, but until recently nearly all of the time, thought, and inspection was confined to shop practice. At the last Safety Conference held by the Department of Labor and Industry, one speaker was assigned the subject—"Reducing Accidents on Construction Operations." This was a start. We would be pleased to have more of it.

Various signs and caution signals have been devised for the shop workers, but on a building the only sign is at the entrance—"DANGER KEEP OUT."

The workers would like better scaffolds; toe boards; guard rails; overhead protection; good ladders, so placed that they can be used readily; stairways that are lighted and clean; a receptacle for all kinds of refuse; clean and well-guarded floors; but these conditions on buildings are the rare exception and not the rule. To get them some one must be continually taking the matter up with the foreman or superintendent, and then that person is stamped as a "Chronic Kicker," and sometimes moved off the operation entirely.

Recently there were several construction operations where it was difficult to maintain a working force due to lack of safeguarding the workers. The workers, rather than complain or take a chance under the unsafe conditions, quit and sought employment elsewhere.

Safe practice in the building industry is a good investment, as is evidenced by the amount of work done by the employe, the class of men attracted to such

an operation, and the small labor turnover. The workers hope the beneficial results obtained by the Department of Labor and Industry during this special movement in the building industry will be of a permanent nature.

POOR AIR IN POOLS AND GYMS MENACE TO HEALTH

Famous Swimming Coach Says Better Ventilation Would Help Athletic Activity; Rickard Plans Chain of Arenas.

The greatest need of the American people today is more systematic exercise, more swimming pools and more gymnasiums, but most of all better air conditions to promote health and athletic work, William Bachrach, famous swimming coach of the Illinois Athletic Club, Chicago, declared.

Swinging the cudgels on swimming pools and gymnasiums which are poorly ventilated, Coach Bachrach said that many persons are discouraged from taking regular exercise and from more active participation in indoor sports because the air in these places is "disgusting, uncomfortable and slothful and constitutes a real menace."

"In spite of their interest in most of the major sports, professional and otherwise, the American people are becoming effete from the fact that they get little of the rugged, regular exercise so vital to good health and long life," Coach Bachrach continued. "I have been in the pools and gyms of many semi-public institutions and private clubs which have been either too hot or too cold while the odors have been so repulsive as to completely discourage anyone from attempting to play a favorite game or try a 'workout.' Improve the air conditions or proper ventilation of your pools and gymnasiums and you will increase your membership. Exercise in bad air is more harmful than good."

As the organizer and leader of swimming teams which have captured world trophies for years, Coach Bachrach has achieved an international reputation as a swimming expert. His team has been national champion for 13 years in the United States while the I. A. C. teams hold 98 per cent of the world's swimming records. Bachrach has personally taken these winning teams to Honolulu, London, Amsterdam, Vienna and other renowned places and held American honors against the world's greatest.

Cinder block, stucco, 1½ stories, 50x56 feet, Spanish tile roof, hardwood floors, electric light, tile work. Plans in progress.

Residence, Trenton, N. J. Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owner, Frank Gorson, care of architects. Brick, 2½ stories, 27x43 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

Residence and Show Room, Atlantic City, N. J. Architect, A. C. Borzner, 717 Walnut street, Philadelphia. Owners, National Bldg. Inst., care of A. C. Ekholm, Atlantic City, N. J. Stucco and half timber, 1 story, 40x50 feet, 60x200 feet. Plans in progress.

School, Rhode Island avenue, Atlantic City, N. J. Architect, H. A. Stout, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic City School Board, H. H. Young, secretary, Atlantic City, N. J. Fireproof, 2 stories, 222x58 feet, 69x50 feet, composition roof, hardwood and composition floors, hollow tile, safety treads, roof ventilators, iron stairs, fire doors, steel sash and skylights, tile and marble, metal lath (heating, plumbing and electric separate). Plans in progress. Will be ready for bids in two weeks.

Store (add. and alts.), 7 North Broad street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Palace Confectionery Co., on premises. Brick, stone, 4 and 3 stories, 25x45 feet, slag roof, plate glass, tile and marble, heating extension, electric light. Architect will be ready for bids this week.

Residence, West Atlantic City, N. J. Architect, A. L. Brooks, Humphry Building, Atlantic City, N. J. Owner, Benjamin Fox, 1102 Atlantic avenue, Atlantic City, N. J. Frame, stucco, brick, 2 stories, 26x52 feet, tile roof, hardwood floors, hot water heat, electric light, tile work. Owner will build.

Golf Club, Ocean City, N. J. Architect, V. B. Smith, Guarantee Trust Building, Atlantic City, N. J. Owners, Ocean City Harbors Co., care of architect. Frame, 2 stories, 36x100 feet, slate roof, pine floors, tile and marble (heating, plumbing, electric reserved). Architect taking bids due March 1st.

Store and Manufacturing Building, Southeast Corner Fifth and Federal streets, Camden, N. J. Architect, Joshua C. Jefferies, Camden, N. J. Owners, George M. Beringer, Inc., 312 Market street, Camden, N. J. Brick, reinforced concrete, granite, steel, 4 stories and basement, 145x40 feet (plumbing, heating, electric, sprinkler and elevator reserved), slag roof, cement floors, metal lath, tile, marble and terrazzo work, hollow metal sash, fire doors, bond, ornamental iron work, iron stairs, shoring, waterproofing, architectural terra cotta, sprinkler tank, metal store front, metal toilet partitions, bluestone, area gratings, dumb waiters. Architect taking bids due February 26th.

School (alts. and add.), Bellmawr, N. J. Architect, John L. Coneys, Drexel Building, Philadelphia. Owners, Township of Center County, Camden County, N. J. Brick, stone, cut stone, steel, 2 stories and basement, 68x26 feet, black slate roof, cement and maple floors, carpentry and mill work, painting and glazing, hardware, metal lath, hollow metal sash, bond, ornamental iron work. Owners taking bids due March 7th at Bellmawr School.

Factory (add.), Cleveland and Lois avenues, Camden, N. J., \$15,000. Architect, private plans. Owners, H. Kohnstamm & Co., Inc., on premises. Metal process, 2 stories, 45x95 feet, metal roof. Permit issued.

Laundry, Northfield, N. J. Architect, S. Hudson Vaughn, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic County Board of Chosen Freeholders, Atlantic City, N. J. Fireproof, concrete, brick, steel, 1 story, 70x38 feet, slag roof. Lowest bidder, John Green, Pleasantville, N. J., \$18,798. Plumbing, Benjamin E. Labov, 212 Adriatic avenue, Atlantic City, \$2,330. Electric, Charles Miller, Humphry Building, Atlantic City, \$1,190. Heating, Baldwin Vent. Co., 1509 Arch street, Philadelphia, \$2,997.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Delaware Bridge approaches. Grading of connecting road. Sections Ra. 5. 6. and Route 6, Section 17, Collingswood to Westville, Camden County. Excavation, borrow. Certified check, 10 per cent. Deposit of \$10. Owners taking bids due February 28th at noon.

Bridge over Great Egg Harbor, Somers Point to Beasley Point, N. J. Owners, care of War Department, Washington, D. C. Concrete piers, steel pony truss construction, 100 feet, center to center clearance 95 feet, double leaf bascule drawbridge. Work contemplated.

New Jersey Contracts Awarded

High School, Landis avenue, Vineland, N. J. Architects, Guilbert & Betelle, Chamber of Commerce, Newark, N. J. Owners, Landis Township Board of Education, Vineland, N. J. Contract awarded but not signed. H. John Homan Co., Eighteenth and Cherry streets, Philadelphia, \$345,000.

Theatre, Stores and Offices, White Horse pike, Oaklyn, N. J. Architects, Hodgins & Hill, 130 South Fifteenth street, Philadelphia. Owners, William Butler & Son, Oaklyn, N. J. Brick, stone, seating capacity 750, slag roof,

cement floors, hot air heat, electric light, tile work. Contract awarded Wills Bill Co., 1706 Sansom street, Philadelphia.

Stores and Offices (13), Sixth and Cooper streets, Camden, N. J., \$45,000. Architect, name withheld. Owner, name withheld. Brick, 2 stories, 80x114 feet, slag roof, maple floors, plumbing, cement work, hot water heat, electric light, tile work. Contract awarded John C. Gibson, 527 Cooper street, Camden, N. J.

Bungalows (10), Runnymede, N. J. Architect, private plans. Owner, Charles P. Shisler, Broad and Snyder avenue, Philadelphia. Frame and sand finish, 1 story, 24x41 feet, asphalt shingle roof, pine floors, hot air heat, electric light, tile work. Contract awarded Joseph H. Klein & Son, 2813 South Marshall street, Philadelphia.

Residence, Somers Point, N. J. Architect, A. F. Amodio, Commerce Building, Atlantic City, N. J. Owner, R. J. Harris, Ocean City, N. J. Brick, stucco, 2½ stories, irregular size, variegated slate roof, hardwood floors, flagstone, cast stone, ornamental iron, tile work. Contract awarded to William Sharrock, Somers Point, N. J.

Residences (15), 1326-54 Chase street, Camden, N. J., \$60,000. Architect, Howard S. Stevenson, 1029 Chestnut street, Philadelphia. Owner, Frank Sozzi, 523 Line street, Camden, N. J. Brick and block, 2 stories, 18x30 feet, slag roof, pine floors, hot water heat, electric light. Contract awarded to Lawrence J. Robinson, Haddonfield, N. J.

Building, Haddon avenue, East of White Horse pike, Camden, N. J., \$25,000. Architect, private plans. Owners, Levering-Riebel Co., Third and Jackson streets, Camden, N. J. Brick and block, 1 story, 80x84 feet 6 inches, asphalt roof, steam heat, electric light. Contract awarded to George Kessler Cont. Co., 1733 North Marvne street.

Stores (5), Pleasantville, N. J. Architect, A. L. Brooks, Humphry Building, Atlantic City, N. J. Owner, Robert Berry, Pleasantville, N. J. Brick, steel, 1 story, 100x60 feet, slag roof, pine floors, metal ceilings, plate glass, copper work, hot water heat electric light. Contract awarded to P. G. Hannum, Georgia avenue and Thorofrae, Atlantic City, N. J.

Residence and Garage, South Kenyon avenue, Margate City, N. J. Architect, C. H. Adams, Chelsea Bank Building, Atlantic City, N. J. Owner, Albert Magee, care of architect. Frame, brick, 2½ and 1 stories, 24x40 feet, 20x20 feet, slate roof, hardwood floors (heating and plumbing reserved), electric light. Contract awarded to A. B. Bowen, 1 South Delancey Place, Atlantic City, N. J.

Residence, Somers Point, N. J. Architect, A. F. Amodio, Commerce Building, Atlantic City, N. J. Owner, F. S. Summer, 118 South California avenue, Atlantic City, N. J. Brick, 2½ stories, irregular size, variegated slate roof, hardwood floors, flagstone, cast stone, ornamental iron, tile work. Contract awarded to William Sharrock, Somers Point, N. J.

Residence, Somers Point, N. J. Architect, A. F. Amodio, Commerce Building, Atlantic City, N. J. Owner, J. Mack, care of architect. Brick, 2½ stories, irregular size, variegated slate roof, hardwood floors, electric light, tile work, ornamental iron, flagstone, cast stone. Contract awarded to William Sharrek, Somers Point, N. J.

Residence, Somers Point, N. J., \$45,000. Architect, A. F. Amodio, Commerce Building, Atlantic City, N. J. Owner, B. Bill, care of architect. Brick, 2½ stories, irregular size, variegated slate roof, hardwood floors, flagstone, cast stone, ornamental iron, tile work, electric work. Contract awarded to William Sharrock, Somers Point, N. J.

Stores (2), (alts.), 301 Broadway, Camden, N. J., \$12,800. Architect, Herman H. Kline,

Bulletin Bldg., Phila. Owner, Samuel Ellis, Camden, N. J. Brick, 1 story 12x20 feet, slag roof, hot water heat, electric work, new store front, general alterations. Contract awarded to S. Kravetz, 535 S. 57th St., Phila.

Residences (2), 540-42 N. 34th street, Camden, N. J., \$8,000. Architect, private plans. Owner, E. Evantash, 1427 Ormond street, Camden, N. J. Frame 2 stories, 15x52 feet, slag roof, pine floors, hot water heat, electric light. Contract awarded to Henry H. Wilson, Gloucester, N. J.

Miscellaneous Construction News

Church, Norwalk, Conn. (Note location.) Architects, P. L. Fowler Co., 224 East Hanover street, Trenton, N. J. Owners, St. Paul's Protestant Episcopal Church, Rev. Lewis B. Howell, Norwalk, Conn. Stone, 1 story and basement, 60x130 feet, slate roof, stone or tile floors, vapor heat, electric light, tile, marble and terrazzo work. Revised plans in progress. (Note correction.)

Bank, Lexington and Calvert streets, Baltimore, Md. Architect, Parker Thomas Rice, Union Station Building, Baltimore, Md. Owners, Federal Reserve Bank, Richmond, Va. Brick, limestone, steel, 6 stories and basement, 110x100 feet, slag roof, cement floors, steam heat, electric light, metal lath, tile work, rolled steel sash, bond, ornamental iron work. Architect taking bids due March 1st.

Hospital, Greeneville, Tenn. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owner, Dr. Leroy Coolidge, Greeneville, Tenn. Fireproof, 3 stories and basement, 36x100 feet, asbestos shingle roof, concrete or linoleum floors, hollow tile, elevators, safety treads, roof ventilators, waterproofing and dampproofing, ornamental iron, iron stairs, fire doors, tile and marble, metal lath, electric light. Owner taking general and sub-bids.

Auditorium, Wilmington, Del., \$30,000. Architect, John A. McKibbin, Industrial Trust Building, Wilmington, Del. Owner, name withheld, care of architect. Brick, 1 story and basement, 45x111 feet, built-up roof, hardwood floors, steam heat, electric light, structural steel, projected steel lath, billiard tables, shuffleboards, bowling alley. Plans completed. Owner will build.

Residences (4), 209-11-13-15 Jefferson street, Wilmington, Del., \$20,000. Architect, private plans. Owner, James P. Jones, Jr., 635 West Twenty-eighth street, Wilmington, Del. Brick, 2 stories, 20x28 feet, slag roof, pine floors, hot water heat, electric light. Permit issued.

Residences (2), 218-20 East Twenty-ninth street, Wilmington, Del., \$10,000. Architect, private plans. Owner, Jacob Winslow, 921 Market street, Wilmington, Del. Brick, stone, 2 stories, 18x34 feet, slag roof, pine floors, hot air heat, electric light. Permit issued.

Garage, South side Gordon street, Wilmington, Del., \$2,000. Architect, private plans. Owner, Joseph S. Hamilton, 829 Orange street, Wilmington, Del. Brick, 1 story, 72x144 feet, slag roof, concrete floors. Permit issued.

Miscellaneous Contracts Awarded

Residence and Garage, Louisville, Ky. Architect, Carl A. Ziegler, 1012 Walnut street, Philadelphia. Owner, Judge Charles H. Morman, Louisville, Ky. Brick, 2½ stories, 30x40 feet, 18x24 feet, slate or shingle roof, hardwood and cement floors, hot water heat, elec-

tric light, tile work. Contract awarded Palmer Graham, Louisville, Ky.

Shore Approach and Ferry Slip, New Castle, Del. Engineers, Chapman & Fisher, 524 Walnut street, Philadelphia. Owners, New Castle & Pennsville Ferry, Captain L. H. Garrison, New Castle, Del. Frame and timber, 200 feet long, piles, reinforced concrete. Contract awarded Simpson & Brown, 90 West street, New York.

Construction operations in the United States held to a somewhat slackened pace during January, the volume of building activities for the month being well below the figure registered for December, according to statistics compiled by the Associated General Contractors of America. Promise of an early increase in the amount of work under way is seen, however, in the fact that the volume of building contracts awarded during December was the greatest ever recorded for that month of the year.

Construction costs rose slightly during January to reach exactly the same level they occupied one year before. The increase was the reflection of higher prices commanded by construction materials, the average of wages paid in the building trade being the same as in December.

The January volume of construction was 20 per cent. smaller than the mark set in December and was 6 per cent smaller than the volume recorded in January, 1926.

The volume of contracts awarded in December was 13 per cent. greater than that recorded in November and brought the total volume of awards for 1926 up to an increase of 8 per cent. over the 1925 figure.

Increases in the prices of sand, gravel and common brick in several sections of the country were responsible for the rise noted in construction costs last month, it is stated. On a scale which has the 1913 average as its basis, construction costs now hold the 197 level. Last year the trend of these costs was slightly upward until May. During the last half of 1926, a gradual decline was noted. At no time last year was a marked fluctuation noted. A gradual decline in costs has been noted since 1923.

(Continued from page 116)

"When the youthful Canadian, George Young, recently won the Wrigley prize by being the first and only one who swam across Catalina Bay, it was an outstanding example of the body being prepared and conditioned by clean, wholesome air and vigorous exercise as well as one of strong physical and moral courage," Coach Bachrach said.

He pointed out that physiological tests conducted by the United States Public Health Service and the American Society of Heating and Ventilating Engineers on more than 300 men in a special air research laboratory in the bureau of mines at Pittsburgh has clearly established the fact that air conditions bring more severe reactions to athletes and people working or exercising violently than to those at rest or in ordinary activities.

"I have been told that these tests show that pulse rate, body temperature, respiration and blood pressure increase with the room temperature and humidity," Coach Bachrach added. "Considerable

body moisture and heat are thrown off in work or exercise and that's why the ventilation should be so handled as to carry this off and constantly supply clean, fresh air of the correct motion, temperature and humidity. It is an axiom of physiology that a man should give off heat to be healthy. If you don't have body heat you don't have energy. A man who lives or works in a room that is well ventilated throws off more heat than when in a room not ventilated.

"We have heard much recently that mechanical ventilation or the manufacture of weather within buildings has been reduced to an exact science. We need more of this in our gymnasiums, arenas and other public gathering places. I have attended several boxing shows where patrons insist on smoking. Ventilation is needed to carry this out. We need more of it in theatres."

Coach Bachrach called attention to the fact that Tex Rickard, famous promoter of fights and other sporting events of national appeal, has announced that he proposes to build a chain of arenas and athletic buildings throughout the country. Plans are to provide the best of air conditioning systems for these, it was stated. It was pointed out that in the huge new Madison Square Garden in New York during prize fights, horse shows and other entertainments where between 15,000 and 20,000 persons gather under one roof, an endeavor is made to keep the air clean and fresh by motors of 300 horsepower. Air is changed constantly by blowing in a fresh supply.

Coach Bachrach believes that the air in any gymnasium should be similar to that of an ideal, balmy day in June. This would mean a temperature of about 68 degrees, a relative humidity of between 40 and 45 degrees and a slight motion of air. This sort of conditioning can be done electrically.

THE A. S. T. M. SPECIFICATIONS FOR BUILDING BRICK

With Special Reference to the Absorption Test and Its Application in Practice

BY W. C. KOCH

The Compression and Transverse Tests

These have a direct relation to the use of the material and disclose properties which are actually required in practice. The exact relations between the results of the tests and practical requirements are being constantly investigated, thereby giving promise of better and better interpretive data for the use of building designers. The fact that the properties tested and the properties required in practice are so nearly on common ground is therefore resulting in a very satisfactory development in actual use of these sections of the Building Brick Specifications.

The Absorption Test

The results of this test, on the contrary, are far removed from the properties sought to be evaluated. In all the literature on this subject the question of permanence and weather resistance in structures is the admitted principal object of the test. The assumption is that these properties increase inversely with the absorption of burned clay materials.

This assumption is immediately subject to two interpretations, first, that increased absorption is the cause of decreased weather resistance and, second, that increased absorption merely accompanies proportionately the actual causes of decreased weather resistance and is therefore eligible to serve as a measure thereof.

In consequence it at once becomes essential in considering the merits of the test to examine into the actual causes of weathering and to see to what extent these may or may not be directly traceable to the absorption of the material. If not so traceable, and in addition, if the actual causes are found to bear no calculable ratio to the absorption percentage of the material, then it will be necessary to discard this requirement of the specifications as a measure of durability and to discover by means of appropriate research what practicable substitute may be offered in its place.

Types of Disintegration or Weathering

Long and detailed observation, carefully checked with the observations of others, indicates three types of disintegration:

(1) The erosion type. Frequently found on chimney tops, bases on high walls and extensively on wall copings or exposed balustrades. It is most frequent on vertical surfaces. The mortar is subject to it as well as the brick.

The appearance is that of a wearing away of corners and surface of the individual units with detachment of flat slabs of the material which will partially adhere for long periods until accidentally dislodged. In extreme cases which have been observed the disintegration of the brick and mortar has rendered useless as much as an inch and a half of the wall thickness in a period of eighteen years.

(2) The spalling type. Frequently found on undrained horizontal exposures such as the tops of retaining walls, driveway surfaces, brick steps and the like.

Sharp fractures with detachment of chips and spalls characterize this type of disintegration. Irregular hair cracks precede the advance of the disintegration in the individual unit. It is rarely accompanied by the failure of the mortar.

(3) The lime type. This has nothing to do with weathering but is due to the presence of limestone pebbles or particles which have been oxidized in burning but

have not reached the combining temperature. In this state they air-slake under appropriate conditions and are in some instances capable of completely destroying the product. In other cases conical spalling takes place, each conical spall having a line particle as its apex. This air-slaking takes place most actively during warm, moist weather. It is of infrequent occurrence in most localities since raw materials subject to this danger are ordinarily avoided.

Cause of Types 1 and 2

Type 1, the erosion type of disintegration, is in all probability due exclusively to underburning of the product. Underburning may result in disintegration in two ways:

First, although the material is generally possessed of sufficient residual pore space to accommodate the expansion of freezing particles of water it must nevertheless also have sufficient internal bond to deflect the ice crystals into the available space during their formation. In the absence of this degree of internal bond a gradual internal separation of the particles takes place under repeated freezing and thawing.

Second, the internal bond undoubtedly depends upon certain chemical combinations progressively formed and stabilized during burning and becoming less water-soluble with increased temperatures. There are probably ranges of temperature and conditions for each material which produce a satisfactory appearing product yet leave in them partially soluble substances essential to the proper cohesion of the product. Such a product differs from a well-burned product having the same absorption in that it suffers a gradual loss of internal strength by solution of these essential substances.

The first of these actions can take place only in relatively severe climates but the second may take place anywhere.

Type 2, the spalling type of disintegration, takes place only in connection with materials of low absorption. In undrained exposures such a material will frequently be subject to water penetration and subsequent freezing. Since there is little or no residual pore space (pore space not easily penetrated under normal pressures) the attempt to resist instead of to accommodate the expansion of the ice crystals must result in rupture. The spalling type of disintegration is unknown in the absence of frost.

If these conclusions are correct, how then is the liability of disintegration or weathering measured by the absorption test? We may very well ask ourselves the following four questions:

(1) Must a definite minimum of absorption be present to produce the erosion type of disintegration and a definite maxi-

mum of absorption to produce the spalling type?

Answer: Yes, according to the nature of the material.

(2) Can a material having a great percentage of absorption be free from danger of the erosion type of disintegration?

Answer: Yes, according to the nature of the material.

(3) Or a material having a small percentage of absorption be free from the danger of the spalling type of disintegration?

Answer: Yes, according to the nature of the material.

(4) Is absorption a measure of the degree of burning?

Answer: No, since almost any degree of absorption may be obtained artificially or by selection of raw materials, all with the same degree of burning.

The conclusion suggests itself that the absorption test does give us some slight amount of information but that the modifications required to reduce this information to a workable basis are of greater significance than the test itself.

Turning for a moment the searchlight of reasoning on the *modus operandi* of the test itself it would seem that the result secured is not the result sought. The test is of interest only so far as it tells the story of the internal water exposure to which a burned clay unit is subject. But it does not tell this story. A ridiculous example may serve best to bring out this failing most clearly. Assume two bricks of equal size, each absorbing under the conditions of the test one-half pound of water. The first brick weighs five pounds with a specific gravity of about two. The other is made of platinum and weighs approximately fifty pounds with a specific gravity about twenty. The absorption of the clay brick is 10 per cent, whereas that of the second is 1 per cent. The internal water exposure of the two is identical.

In England the absorption percentage has long since been discarded in favor of the porosity percentage, though neither is used as a practical test for weathering qualities. With a possible more sweeping change in view it would seem unwise to advocate an intermediate substitution of this character. This is particularly true on account of the relief afforded by the regional modification clause adopted last June, which to a certain extent relieves the situation from a growing danger of damaging criticism.

Means should be developed to go to the root of the matter. Rules for the gathering of specimens are needed. Disintegration of individual bricks in the midst of others which have remained perfectly intact is a frequent occurrence so that no reliability can be placed upon specimens selected by location in a wall.

The only specimens which can safely be studied are intact parts of disintegrated brick.

In my opinion the absorption test with its regional modification or some other effective modification can be left in status quo until such time as the society is in a position to offer a test which reduces comprehensive field experience to a laboratory basis and which takes into account the very difficult problem of extreme variations in the behavior of burned clay products composed of capricious raw materials manufactured by numerous methods under non-standardized conditions.

—*The Clay-Worker.*

MATERIAL ENTERING INTO STEEL COLUMNS AFFECTS STRENGTH MORE THAN CHANGES IN TYPE OF CONSTRUCTION

Results of tests recently completed on full-sized steel columns at the Bureau of Standards, Department of Commerce, show that under present specifications differences in the physical properties of the material entering into sturdy columns produce greater variation in the column strength than all the differences in type of construction.

This work was conducted in co-operation with the American Bridge Company and the Bethlehem Steel Company. These firms furnished more than 130 tons of steel meeting specifications under which structural steel is usually purchased. This was fabricated into 69 columns having H-shaped sections and of five different types of construction. The finished columns were tested to destruction in the 10,000,000 pound testing machine of the Bureau. Likewise, over 1,000 test specimens were cut from the columns and subjected to chemical analyses and physical tests to determine as accurately as possible the properties of the steel from which the columns were made. All of the material met the specifications under which it was furnished, but differed greatly in tensile yield point.

Although much work has already been done on columns, the subject of column strength and method of design, especially in large sizes, is still a matter for so much discussion that the additional data which these tests have furnished will be of great value to engineers.

This work is fully described in Technologic Paper No. 328, copies of which may be obtained from the Superintendent of Documents, Government Printing Office, Washington, D. C., at 40 cents each.

The BUILDERS' GUIDE is in its fortieth year of continuous publication.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

No Property Is Immune

to windstorm damage. No section of the country can claim, "The wind can never cause destruction here."

Insurance against destruction or damage occasioned by violent winds will add very little to your insurance budget, but add a great deal to the safety of your property investment.

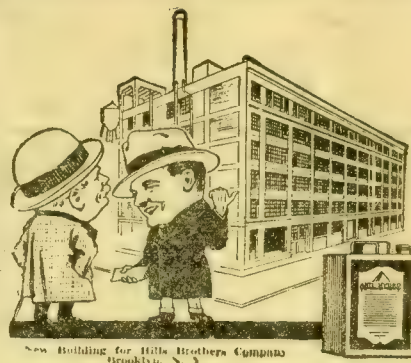

Your agent can give you windstorm insurance in a reliable company.

"ANTI-HYDRO" Preserves the Concrete Floors in this Preserving Factory

The concrete floors in this building are subjected to the action of fruit juices, acids and chemicals which would ordinarily deteriorate them if the concrete were not protected with "ANTI-HYDRO" throughout the one-inch topping.

In addition to making concrete acid, alkali and oil resisting, "ANTI-HYDRO" also permanently hardens and waterproofs concrete—all in one operation.

"ANTI-HYDRO" is an indispensable time and money saver in cold weather because it lowers the freezing point of concrete and cement mortars to 15 degrees F. This makes it possible to work during freezing weather and to complete your contracts on time with prompt payments.

Because "ANTI-HYDRO" is a liquid integral compound, it mixes easily with the gauging water—no skilled labor is required.

The 22-year record of "ANTI-HYDRO" results is proof of its permanence. Use it on your next job.

Total	1,796	\$10,639,193	2,260	\$13,215,371
Comparative Total	1,736	\$10,442,419	2,196	\$12,956,486

*Not included in Comparative Total. **Includes figures for Carrick borough.

Building operations during January, 1927, showed a drop of 19.4 per cent. under January, 1926, according to the reports submitted by building inspection offices in 36 Pennsylvania cities and boroughs to the Department of Labor and Industry. The estimated cost of building operations for which 1,736 permits were granted in the 36 cities and boroughs

during January, 1927, totaled \$10,442,419, representing a reduction of \$2,514,067 from the total for January, 1926. Notwithstanding this considerable loss, 22 of the 36 cities reported substantial gains in building volume over January, 1926. Thirteen localities reported decreased building activities. The building slump in Philadelphia exceeded by far

that of any other city. The volume of January building in Philadelphia dropped \$4,336,490, or 57 per cent. below the total for January of last year. The drop for Pittsburgh was not nearly so heavy, being only \$454,502, or 12 per cent., under last year. Other cities that showed losses in building volume of some consequence are Altoona, 50 per cent.; Clairton, 76 per cent.; Duquesne, 74 per cent.; and Harrisburg, 47 per cent. Hazleton, McKees Rocks, and Monessen granted no permits in January, 1927. Donora did not record the issuance of building permits in January of either year.

The losses in city building were confined largely to Philadelphia and Pittsburgh. Building operations in cities of 50,000 to 100,000 population and in some large boroughs have shown big gains. The 22 places that showed increased building in January, 1927, over January, 1926, were:

City	Increase	
	Amount	Per Cent.
Allentown	\$373,225	246
Ambridge	39,300	122
Bethlehem	41,650	108
Bradford	8,700	57
Carlisle	42,762	104
Easton	8,365	17
Erie	115,620	96
Homestead	4,400	55
Lancaster	167,828	494
Meadville	40,675	889
New Castle	17,200	30
Oil City	19,700	127
Pottsville	664,900	7,915
Reading	64,575	50
Scranton	618,437	487
Shamokin	21,400	189
Uniontown	53,750	186
Washington	3,305	16
Wilkes-Barre	5,547	8
Wilkesburg	64,300	54
Williamsport	79,210	738
York	101,140	269

The analysis of types of buildings in 28 cities for which building permits were secured in January, 1927, shows several items of considerable interest. Contrary to expectation, more than 60 per cent. of the building loss was in the one-family-dwelling class. This class dropped from 545 in January, 1926, to 218 in January, 1927, while the average cost of construction per single dwelling mounted from \$4,956 in January, 1926, to \$5,337 in 1927, an increase of 7.7 per cent. It was thought that the largest decline would be shown in buildings of the office, store, hotel, and industrial types.

To what factors the increased average cost of one-family-dwellings is attributable cannot be definitely stated. Price declines in primary building materials have probably been offset by increased wage

*Number of Permits—Buildings Not Given.

rates in building trades. No doubt superior design, appointments, and materials have had some share in the increased building cost. Another item of interest is that there is no slackening of small apartment building notwithstanding the common report that the market is surfeited with buildings of the multi-family type.

Prevalent opinion for building and construction is for another big year in 1927. January reports indicate that this year will fall below the levels of 1925 and 1926. Commercial and industrial building needs have been satisfied in most cities and single dwelling construction has not yet shown the expected increase. Public works and municipal improvements probably will constitute a large share of the 1927 volume of building.

BUILT-IN BEDS

In helping to secure the maximum efficiency of floor space in our modern homes, the built-in bed plays a most important part.

As a great majority of the buildings erected today are small residences, each one is a prospect for a built-in bed. An extra bed is a convenience in practically every household and where rooms can conveniently be made to serve a dual purpose, the built-in bed is an outstanding economy as it saves the erection of another bedroom which would be required.

In commercial buildings, factories, etc., such a bed may be conveniently used in the ladies' rest room. Here it occupies no space until an emergency arises when it can be easily brought into use. The

same is true of any first aid room. One or more beds can easily be brought into use when necessary while at other times the space is available for other purposes.

An additional use for beds of this type is in existing structures, remodeling work, etc. There is many an old fashioned building hard to rent that can be converted into small apartments by the use of built-in-beds and other built-in features. A case in point follows:

A woman who leased a large apartment building in Chicago for sub-renting found that renting 8-room apartments was a more difficult matter than she had anticipated when she leased the building. Tenants didn't seem to want such large apartments. This became very evident as apartment seekers, after viewing the vacant apartments, turned away with a

"No, I guess we don't care for so many rooms."

Her experience with these visitors, who failed to put their names on the "dotted line," convinced her that if she had smaller apartments to rent, at reasonable prices, in the high class neighborhood in which her apartment building is situated, she would get as many tenants of the class she desired as she could accommodate.

The question then was what to do about it. She was tied by up a lease, with an apartment building containing six 8-room apartments. The building was ten years old and her predecessor had experienced the same difficulty in sub-leasing the apartments. This does not mean that she was unable to rent most of the apartments, but if one apartment, renting at \$225 a month—which computed on an annual basis is 6% on an investment of \$45,000—remains vacant in a six apartment building, it cuts considerably into the profits. And she had no intentions of just making a bare living out of her business, with the danger of actual loss menacing her at all times.

Thousands of apartment owners through the United States today face the same situation and the same is true of landlords who rent rooms in large houses, originally occupied by wealthy families who have moved into other neighborhoods.

There was only one solution of this woman's problem, and that was to remodel the six 8-room apartments into smaller ones, which would rent for less money and meet the requirements of prospective tenants.

It was about this time that a representative of a built-in-bed manufacturer called upon her. She told him of her difficulties and he gave her the solution. Citing facts and figures, he showed her how easily the building could be remodeled, and how by the use of such beds, each of the many new small apartments could be made into pleasant living quarters, with ample space to provide a real home for the occupants.

These beds, he explained, when not in use, could easily be put up, out of the way, entirely concealed in closets, recesses in the wall, or by canopy draperies in harmony with the other decorations and the color scheme of the apartment.

He submitted floor plans which his company's Service Department had drawn up, showing her how the six large apartments could be remodelled into 36 one-room, two-room and three-room apartments, from which the income would be almost three times as great as that she would receive from six 8-room apartments if all were rented.

The owner followed the salesman's advice and now, a year later, his predictions have been fulfilled. There are 36 small

Type of buildings to be erected according to the permits issued in twenty-eight (28) Pennsylvania cities and boroughs for January, 1927, compared with January, 1926.

Type of Buildings	1927		1926

apartments in the building and they are fully rented, while there is also a waiting list of prospective tenants. The apartments rent at \$60, \$80, and \$125, according to their size and location, and this woman has, in fact, almost tripled her income. The apartments were rented furnished, but little was needed as so much was built in.

It was by the installation of these beds that the success of her venture was made possible. They were easy to handle so that a child could manipulate them, save so much floor space, that, in effect, they give to each apartment one or two extra rooms, as each room furnished with a

built-in bed served two purposes—that of living room by day and a bedroom by night. If the regular type set-up bed had been installed, the sleeping room could only have been used for sleeping and dressing purposes; there would have been no place for entertaining guests and the room could not have been used as a living room.—*Building Age and National Builder.*

If your sales-talk is keyed to interest men who build it should occupy space every week in the "Guide," the only building news magazine this side of Manhattan Island.

"ANTI-HYDRO" Preserves the Concrete Floors in this Preserving Factory

The concrete floors in this building are subjected to the action of fruit juices, acids and chemicals which would ordinarily deteriorate them if the concrete were not protected with "ANTI-HYDRO" throughout the one-inch topping.

In addition to making concrete acid, alkali and oil resisting, "ANTI-HYDRO" also permanently hardens and waterproofs concrete—all in one operation.

"ANTI-HYDRO" is an indispensable time and money saver in cold weather because it lowers the freezing point of concrete and cement mortars to 15 degrees F. This makes it possible to work during freezing weather and to complete your contracts on time with prompt payments.

Because "ANTI-HYDRO" is a liquid integral compound, it mixes easily with the gauging water—no skilled labor is required.

The 22-year record of "ANTI-HYDRO" results is proof of its permanence. Use it on your next job.

As The Editor Sees It

PUBLIC LOOKS TO ENGINEER TO THAW OUT FROZEN PRACTICES

An Address by LEE H. MILLER, *Chief
Engineer, American Institute of
Steel Construction, Inc.*

When structural steel first began to come into use in England, an English engineer in drawing up the specifications for the composition of the steel to be used for a certain structure, expressly stated that the steel must contain no copper.

The specification made its way to America. American engineers, with little or no experience in the use of the new structural material, decided that the Englishman's specification was a good one to follow. They didn't know why he had out-lawed copper, but they felt that he must have had sufficient reason for the taboo.

For years, specifications for structural steel in this country and England contained a proviso against any trace of copper. Then someone discovered that the presence of copper was one of the best guarantees against the possibility of corrosion. Engineers began to wonder why copper had ever been banned.

A short investigation disclosed the rea-

son. The Englishman had had nothing against copper. He simply had not known what the effect of the copper would be; so he had made up his mind to play safe by making sure that the steel he used didn't contain any.

First ignorance, and then a blind following of precedent, were responsible for the taboo against an element that is now recognized as going far to assure a potential life span of almost unlimited duration for our great steel frame structures.

Since the initial use of steel as a building material we have made tremendous advances in technical knowledge. There may be some incompetent structural engineers, just as there are incompetent doctors or incompetent business men, but ignorance of essential facts no longer imposes a serious handicap upon the construction industry.

There rests upon the engineering profession, however, an obligation to the public which extends beyond the boundaries of technical skill—beyond doing what we are paid to do and no more. The tendency towards inertia in industrial development must be offset by the alertness of the engineer to apply the results of research and investigation.

We who design and erect the nation's

buildings and bridges must not be governed by the process of reasoning which influenced the early structural engineers who took it for granted that the Englishman knew what he was doing when he kicked copper out the back door.

It is true that change for the sake of change alone will get us nowhere. But it is equally true that a distrust of change because it is change will bring progress to a standstill.

Stagnation, if not disaster, is inherent in the inclination in some quarters to believe that because a certain type of structure has always done well enough, it will continue to serve; that because methods are hoary with precedents they must be based upon almost divine authority.

The recent Florida hurricane gave a rude jolt to such an attitude. Many years of exemption from severe storms had lulled builders and the general public into the belief that the peninsula was secure from the visitations of such devastating outbursts of nature, and that any structure capable of sheltering the people under normal conditions was plenty good enough.

The consequence was that thousands of buildings, entirely comfortable and adequate when the sun shone and the gentle

trade winds blew, went down like houses of cards when suddenly swept by a tempest of gigantic proportions.

We know now, after an appalling loss of life and property, that certain essential precautions were entirely overlooked because of a false sense of security. We know, too, that if these precautions are taken we can build to resist the hurricane.

The Florida disaster taught us that structures in hurricane areas must be able to endure not only the steady force of the wind, but a series of tremendous gusts which buffet them now from one direction, now from another—which shake them as a terrier shakes a rat. We have seen that the vacuum created on the side of the building not exposed to the wind exerts a more dangerous force than the direct impact of the gale.

It has been brought home to us that, in addition to the wind pressure, the force of the rainfall must be provided against. Mr. F. E. Schmitt, an Associate Editor of *Engineering News-Record*, who made a survey of the devastated area, has stated that in his opinion the rain was hurled against the buildings with a force equivalent to that of a hose stream under 250 pounds pressure.

It has become apparent that the building codes in sections of the country subject to visitations of the hurricane need revision. At the present time the Standard Specification of the American Institute of Steel Construction is the only specification, of which we have record that provides that the frame of the structure must be able to carry the wind pressure.

It seems to have been generally considered, by the formulators of other specifications, that the wind factor can be taken care of by the walls, the walls and frame combined, or by the inertia of the structure itself. Such a belief is not conducive to safe construction in hurricane areas.

Disastrous conflagrations, like the September hurricane, have served at least one useful purpose. Study of their effect upon various types of structures, and various structural materials, has pointed the way to measures which have steadily diminished the loss of life and property by fire.

It is difficult for the present generation to imagine the grip once held by the fire fiend upon our large cities. In lower New York there is a tablet that to this day marks the origin of the fire of 1835 by which a great part of the business district of lower Manhattan was

swept away.

Six hundred buildings were destroyed. The insurance companies suspended operations. Two hundred and sixty business houses went bankrupt. Only glowing safes marked where financial institutions had been.

Towering skyscrapers, tenanted by nearly a million workers, now occupy this region. Better fire-fighting methods combined with gradually developed systems of fire-proofing have kept the section free from anything like a general conflagration for nearly a hundred years.

Nevertheless, the engineer should avoid an attitude of complacency in regard to measures already taken to diminish the fire hazard. Still, every time our clocks tick off a minute, property valued at \$1,000 goes up in smoke and flame. The Baltimore, Chicago, and San Francisco fires are not occurrences of remote antiquity.

How far we lag behind Europe in dealing with the fire menace is shown by the comparative per capita fire losses. In England it is around thirty-three cents, France forty-nine cents, Germany twenty-eight cents, Holland eleven cents. In America the annual toll we pay is in the neighborhood of five dollars for every man, woman, and child in the country.

In this country we do not impose penalties upon those persons in whose homes or business structures fires originate. We have come to regard fires as accidental occurrences, for which, except in the case of arson, no one is to blame. As a consequence our laws contain no provisions for punitive action.

Europeans see the situation in a different light and many countries on the other side of the Atlantic enforce stringent laws which hold responsible for the resulting damage, the man upon whose premises a fire starts. He is regarded as an offender against the prosperity and security of his country. He pays the penalty.

Some measure of responsibility for the tremendous fire loss in the United States may properly be attributed to the lack of laws which penalize the delinquent property holder, but while such enormous losses continue we cannot escape the charge that our present methods of fire-proofing are unscientific. It is even more certain that they are economically wasteful.

Steel construction affords an illustration of the latter point. Steel, as every-

Arena, Central Philadelphia, \$5,000,000. Architect, Thomas Lamb, 644 Eighth avenue, New York. Owner, Tex Rickard, 825 Fifth avenue, New York, care of A. M. Greenfield, Bankers' Trust Building, Philadelphia. Seating capacity, 18,000. Approximate size, 220x325 feet. Plans in progress.

Hotel, Southeast Corner Carlisle and Pine streets, Philadelphia. Architect, C. E. Oelschlager, 1615 Walnut street, Philadelphia. Owner, name withheld. Brick, steel, concrete, limestone, 20 stories and basement, 80x116 feet. Preliminary plans drawn. Work contemplated.

Hospital Building, Broad street below Vine; **College Building**, Fifteenth street below Vine street, Philadelphia. Engineer, H. Hall Marshall, 370 Lexington avenue, New York City. Owners, Hahnemann Hospital, on premises, Walter E. Herring, president of Board of Trustees. Limestone, steel, concrete, brick, 17 stories. Plans in progress.

Fraternity House, Thirty-ninth and Delancey streets, Philadelphia. Architect, S. W. Marshall, 1524 Chestnut street, Philadelphia. Owners, Delta Kappa Epsilon, 3906 Spruce street, Philadelphia. Stone, 3 stories. Plans in progress.

Apartment House, Northwest Corner Forty-sixth and Chester avenue, Philadelphia. Owner, Nathan Litman, Northeast Corner Forty-fifth and Pine streets, Philadelphia. Brick, steel and limestone, 4 stories. Work contemplated.

Apartment House, Forty-seventh and Forty-eighth streets, Spruce and Pine streets, Philadelphia. Owner, Clarence R. Siegel, Forty-seventh and Pine streets, Philadelphia. Nine units, court yards, underground garage, power plant, etc. Work contemplated.

Office Building, Sixty-ninth and Market streets, Philadelphia. Engineers, William Steele & Sons Co., Fifteenth and Race streets, Philadelphia. Owner, John H. McClatchey, 11 South Sixty-ninth street, Upper Darby, Pa. Brick, steel, concrete, stone, size and stories not decided. Preliminary plans in progress. Engineer will build.

Garage, 531-33 Bainbridge street, Philadelphia. Architect, private plans. Owner, I. Madzkin, on premises. Brick, steel, concrete, 2 stories, 37x125 feet, slag roof, cement floors, ramp, steam heat, electric light, rolled steel

sash. Owner will be ready for bids in three weeks.

Residences and Stores (3), 6033 Rising Sun avenue, Philadelphia. Architect, private plans. Owner, M. Weintraub, Northeast Corner Eighteenth and Cumberland streets, Philadelphia. Brick, 2 stories, 14 feet 4 inches x 58 feet, hot water heat, electric light, slag roof, yellow pine floors, metal ceiling. Owner taking bids due as soon as possible.

Residences (20), Welsh road and Erdrick street, Holmesburg, Pa. Architect, private plans. Owner, F. A. Morse, Jr., care of builder. Brick, 2 stories and basement, 16x40 feet, slag roof, oak and pine floors, hot water heat, electric light. J. G. Patterson, 2114 Lombard street, Philadelphia, taking sub-bids due as soon as possible.

Apartment Building (40), Twelfth and Loudon streets, Philadelphia. Architect, J. Frank Clark, 23 South Sixteenth street, Philadelphia. Owner, care of Carl Hirsch, 1718 Cherry street, Philadelphia. Brick, 4 stories, hot water heat, electric light, metal lath, tile work, slag roof, hardwood floors, metal weather strip, wire work, cast stone, brass pipe. Carl Hirsch, 1718 Cherry street, Philadelphia, taking sub-bids due as soon as possible.

Factory, Erie avenue and I street, Philadelphia. Architect, private plans. Owners, J. S. Thorn & Co., A. L. Doering, president, Twentieth and Allegheny avenue. Steel frame, 1 story, 300x500 feet, gypsum roof, electric light, rolled steel sash. Plans in progress. Owners will build and sub-let.

Residences (23), Fifty-eighth and Malvern avenue, Philadelphia, \$100,000. Architect, private plans. Owner, Harry Wolf, 5201 Berks street, Philadelphia. Brick, 2 stories, 16x43 feet, slag roof, hardwood floors, hot water heat, electric light, tile work, metal lath, terra cotta, wire work. Owner and builders taking sub-bids due March 10th.

Residences (26), Penn and Anchor streets, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, J. W. Collins, 5445 West Berks street, Philadelphia. Brick, 2 stories, 15x34 feet, slag, cement, tile roof, hardwood floors, hot water heat, electric light, metal lath, tile work, basement garages. Owner taking sub-bids.

Residences (28), Sixty-eighth avenue and Twentieth street, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, J. Harry Parker, 5583 Old York road, Philadelphia. Brick, 2 stories, 14½x'2 feet, slag and tin roof, hardwood floors, cement work, garages in basement, hot water heat, electric light. Owner taking sub-bids.

Factory, Twenty-first and Allegheny avenue, Philadelphia. Engineers, William Steele & Son, Fifteenth and Cherry streets, Philadelphia. Owners, Steele Heddle Mfg. Co., on premises. Reinforced concrete, brick, steel, 5 stories and basement, 100x96 feet, slag roof (plumbing, heating, electric reserved), asphalt floors, hollow tile, elevators, metal lath, rolled steel sash, fire and kalamein doors, rolled steel doors, elevator doors, metal toilet partition, demolition. Plans in progress. Engineer will build.

Residences (26), Penn and Anchor streets, Philadelphia. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owner, J. W. Collins, 5445 West Berks street, Philadelphia. Brick, 2 stories, 15x34 feet, slag, cement, tile roof, hardwood floors, hot water heat, electric light, metal lath, tile work, basement garages. Owner taking sub-bids.

Apartment House, Forty-second and Ludlow streets, Philadelphia. Architect, John J. Carroll, 1619 Chestnut street, Philadelphia. Owner, care of architect. Brick, steel, concrete, stone trim, 4 stories and basement, 35x106 feet, 28 apartments and one store, hot water heat, oil burning, electric light, built-up roof, hardwood and mineral floors, electric elevators, kitchen equipment, incinerator, Murphy door beds, metal skylights. Plans in progress. Architect will be ready for bids March 18th.

Sub-Station No. 5, Mt. Vernon and Broad streets, Philadelphia. Owners, Department of City Transit, 1211 Chestnut street, Philadelphia. Reinforced concrete, brick, steel, 1 story, 103x50 feet (plumbing, electric separate), slag roof, cement floors, roof ventilators, shoring, dampproofing, ornamental iron work, bond, rolled steel skylights, marble work, bluestone, limestone, hollow metal partitions. Owners taking bids due March 15th.

Residence, Swoyerville, Pa. Architects, Schroeder & Schmidt, Weitzenkorn Building, Wilkes-Barre, Pa. Owners, Holy Trinity Church, Rev. J. Karnish, Swoyerville, Pa. Frame, brick, veneer, 2½ stories, 40x52 feet, slate roof, hardwood floors, vapor heat, electric light, tile work. Plans in progress.

Bridge, Marple avenue, Baltimore avenue and Riley avenue, Oakview, Pa. Engineer, George Wright, County Engineer, Delaware County, Media, Pa. Owners, County Commissioners, C. Agnew, Upper Darby, Pa. Site approved. Preliminary plans in progress.

Residence, Wynnewood, Pa. Architect, Franklin D. Edmunds, Real Estate Trust Building, Philadelphia. Owner, Walker E. Linville, Land Title Building, Philadelphia. Stone, cut stone, brick, steel, 2½ stories and basement, 41x43 feet, tile roof, oak, pine and cement floors, metal lath, tile work. Revised plans in progress.

School No. 42 (add.), Scranton, Pa. Architect, A. J. Ward, County Bank Building, Scranton, Pa. Owners, Scranton School Board, 425 North Washington avenue, Scranton, Pa. Brick, steel, 2 stories, 8 rooms, built-up roof, maple floors, safety treads, roof ventilators, waterproofing and dampproofing, iron stairs, bond, fire doors (heating, plumbing, electric separate). Preliminary plans in progress.

School No. 32, Scranton, Pa., \$400,000. Architect, Frank J. Miller, Brooks Building, Scranton, Pa. Owners, Scranton School Board, J. Hughes, secretary, 425 North Washington street, Scranton, Pa. Brick, steel, 2 stories, 30 rooms and gymnasium, built-up roof, maple floors, safety treads, roof ventilators, iron stairs, bond, fire doors, metal lath (heating, plumbing and electric separate). Preliminary plans in progress.

Nurses' Home, Blakely, Pa. Architect, A. J. Ward, County Bank Building, Scranton, Pa. Owners, Mid-Valley Hospital, Blakely, Pa. Brick. Plans in progress. (Note architect.)

Hospital (add.), Blakely, Pa. Architect, A. J. Ward, County Bank Building, Scranton, Pa. Owners, Mid-Valley Hospital, E. S. Jones, president, Blakely, Pa. Brick. Architect will take bids in a few weeks. (Note architect.)

School, Kennett Square, Pa. Architects, Hoffman-Henon, Finance Building, Philadelphia. Owners, St. Patrick's Roman Catholic Church, Rev. Austin C. Grady, on premises. Brick, cut stone, stone, steel, 3 stories and basement, slate roof, cement and maple floors, metal lath, rolled steel sash, kalamein and hollow metal doors, bond, ornamental iron work, limestone, area gratings, metal toilet partitions. Architects taking bids due March 14th.

Buildings (3), Hatboro, Pa. Architect, private plans. Owners, Roberts & Manders Stove Co., Mr. Roberts, Eleventh and Washington. Reinforced concrete, brick, cut stone, steel, Building G, 3 stories and basement, 60x124 feet, Building H, 3 stories and basement, 66x199 feet, Grating Building, 1 story building, 41x111 feet (heating, plumbing, electric, sprinkler reserved), asphalt roof, cement floors, elevators, hollow metal sash, rolled steel skylights, hollow metal doors, ornamental iron work. Owners taking bids due March 15th.

Residence and Garage, Cheltenham road and Maverock avenue, Montgomery County, Pa. Architect, Carl A. Ziegler, 1012 Walnut street, Philadelphia. Owner, Clarence Brown, care of architect. Stone, 2½ stories and basement, 2 stories and basement, 134x50 feet, wing 32x80 feet, 12x72 feet, slate roof, oak and pine floors, hot water heat, electric light, tile work, metal lath, bond, ornamental iron work. Architect taking bids due March 19th.

Home Economics Building, Cheltenham, Pa. Architects, Davis, Dunlap & Barney, 1805 Walnut street, Philadelphia. Owners, Cheltenham High School, B. Wunderle, secretary,

Cheltenham, Pa. General construction, heating, plumbing, electric, ventilating. Certified check, 1 per cent. Deposit, \$15, refunded. Owners taking bids due March 18th.

Garage and Show Room, Allentown, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Klein Motor Co., 12 North Eleventh street, Allentown, Pa. Brick, steel, 2 stories, 80x128 feet, slag roof, concrete and tile floors, hollow tile, elevators, roof ventilators, waterproofing, ornamental iron, fire doors, steel sash, tile work (heating, plumbing and electric separate). Architects taking bids due March 21st.

Apartment House, Brookline, Pa. Architect, Guy B. Johnson, 237 North Sixteenth street, Philadelphia. Owners, Gordy Brothers, Otis Building, Philadelphia. Brick, steel, concrete, 4 stories and basement, 125x91 feet, slag roof, oak and pine, cement floors, hollow tile, elevators, plumbing, shoring, waterproofing, ornamental iron work, bond, hollow metal doors, rolled steel skylights, tile and marble work, metal lath, steam heat, electric light, limestone, bluestone, incinerators, flagstone. Owners taking sub-bids due as soon as possible.

Residence, Lot 82, Rosedale avenue, Overbrook Hills, Merion, Pa. Architect, E. Allen Wilson, 1208 Chestnut street, Philadelphia. Owners, Messrs. William L. Bushnell and Gustav Bliss, 2145 East Firth street. Frame, 2½ stories, 26x44 feet, garage, 10x20 feet, central heat, electric light, tile work, shingle roof, hardwood floors, cement work. Owners will build.

Residence, Jenkintown, Pa. Architect, private plans. Owner, H. B. Nieweag, Willow street, Jenkintown, Pa. Brick, 2½ stories and basement, 38x26 feet, slate roof, oak and pine floors, hot water heat, electric light, tile work. Owner taking bids due as soon as possible.

Washington School (add.), Salisbury Township, Pa. Architects, Jacoby & Everett, Commonwealth Building, Allentown, Pa. Owners, Salisbury Township School Board, John T. Mory, secretary, Route No. 2, Allentown, Pa. Brick, 2 stories, 35x70 feet, built-up roof, maple floors, safety treads, iron stairs, bond (heating, plumbing, electric separate). Owners will be ready for bids next week.

School No. 33, Quincy street, Scranton, Pa. Architect, A. P. Coon, Traders' Bank Building, Scranton, Pa. Owners, School Board of Scranton, J. Hughes, secretary, 425 North Washington street, Scranton, Pa. Brick, steel, reproof, 3 stories, 30 rooms, slag roof, maple floors, hollow tile, roof ventilators, iron stairs, fire doors, steel skylights, tile work (heating, plumbing and electric separate). Owners will advertise for bids about last of April or first of May.

Residence, Haverford, Pa. Architects, Ritter & Shay, Packard Building, Philadelphia. Owner, E. B. Cox, 3rd, care of C. Barney Co., 1428 Walnut street, Philadelphia. Stone, stucco, 2½ stories. Ready for bids in two weeks.

Residence, St. Davids, Pa. Architects, Dreher & Churchman, Otis Building, Philadelphia. Owner, W. E. Warner, care of architect. Stone, frame, 2½ stories. Architects taking preliminary bid.

Stores and Apartments (5), Burmont road, Drexel Hill, Pa., \$35,000. Owners, Meagher Constr. Co., 4201 Woodland avenue, Philadelphia. Brick, 2 stories, 20x53 feet, hot water heat, electric light, slag roof, hardwood

Pennsylvania Contracts Awarded

High School, Norristown, Pa. Architects, Ritter & Shay, Packard Building, Philadelphia. Owners, School District of Norristown, Pa. Brick, steel, reinforced concrete, 3 stories and basement, 272x149 feet, hollow tile (plumbing, heating, electric separate bids), maple and cement floors, composition roof, roof ventilators, metal doors and sash, marble and terrazzo work, metal lath, acoustical treatment, dumb waiter, area gratings, steel lockers, alberne. Contract awarded on general (limestone) work. P. H. Kelly Co., 1713 Sansom street, Philadelphia, \$451,000.

Residence, Rosemont, Pa. Architect, John J. Carroll, 1619 Chestnut street, Philadelphia. Owner, name withheld. Brick, 2½ stories, 1½ stories and basement, 40x20 feet, wing 16x12 feet, garage, 16x16 feet, shingle and slag roof, oak and pine floors, tile work, bond, hot water heat, electric light, ornamental iron work, rubber floors. Contract awarded John E. Miller, Hampshire road, Drexel Park.

Residence and Garage, Drexel Park, Pa. Architects, Heacock & Hokanson, 1211 Chestnut street, Philadelphia. Owner, Charles Svoboda, Schaff Building, Philadelphia. Stone, half timber, hot water heat, electric light, tile work, brick, 2½ stories, 50x45 feet, asbestos shingle roof, hardwood floors, hot water heat. Contract awarded J. Howard Roberts, Lansdowne, Pa.

Auto Laundry Building, 500 Fishers avenue, Bywood, Pa., \$3,000. Architect, private plans. Owner, W. Harley, 500 Fishers avenue, Bywood, Pa. Brick, 1 story, 17x60 feet, slag roof, cement floors, steam heat, electric light. Contract awarded Harry Harley, 500 Fishers avenue, Bywood, Pa.

Garage, Harrisburg, Pa. Architect, C. J. Lappley, Parkside Building, Harrisburg, Pa. Owner, E. S. Wolf, 18 South Cameron street, Harrisburg, Pa. Brick, concrete block, 2 stories, 72x150 feet, slag roof, concrete floors. Contract awarded to Wilsbach Brothers, 2218 North Third street, Harrisburg, Pa.

Auto Repair Shop, 16 Harwood avenue, Kirklyn, Pa., \$2,500. Architect, private plans. Owner, W. H. Condill, 16 Harwood avenue, Kirklyn, Pa. Cinder block, 1 story, 50x35 feet, roof truss. Contract awarded G. W. Long, 813 Valley road, Llanerch, Pa.

Glen Riddle Bridge No. 6, over Chester Creek. **Hibbard Bridge No. 21**, over West Branch Chester Creek. County engineer, S. C. Hollister, Media, Pa. Owners, Delaware County, G. T. Wadas, Media, Pa. Glen Riddle—2 60-foot reinforced concrete girder spans, 20-foot roadway, 6-foot sidewalks; contract awarded C. A. McDonald, 809 North Sixty-third street, Philadelphia, \$33,000. Hibbard Bridge—60-foot girder span, 20-foot roadway, 6-foot sidewalk; contract awarded Knox Mariana, Ardmore, Pa., \$13,700.

Bridge, over Schuylkill River, Black Rock, near Royersford, Pa. Engineers, Ellin & Cressman, Norristown, Pa. Owners, Chester and Montgomery Counties, Phoenixville and Norristown, Pa. Contract awarded G. A. & F. M. Wagman, Dallastown, Pa., \$132,420.

New Jersey Construction News

Cottage, Ventnor, N. J. Architect, Bertram Ireland, Guarantee Trust Building, Atlantic City, N. J. Owner, name withheld. Frame,

2½ stories, 20x36 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Plans in progress.

Residences (10), West Side, Atlantic City, N. J. Architect, private plans. Owner, John B. Dykes, care of builder. Brick, 2 stories and basement, 18x53 feet, slag roof, oak and pine floors, hot water heat, electric light, metal lath, ornamental iron work, plumbing, plastering, yainting and glazing. J. G. Patterson, 2114 Lombard street, Philadelphia, taking sub-bids due as soon as possible.

Hotel (add. and alts.), South Kentucky avenue, Atlantic City, N. J. Architect, W. B. Riebenack, 19 South Marion avenue, Atlantic City, N. J. Owners, Hotel De Ville, Mr. O'Brien, on premises. Semi-fireproof, steel, brick, 5 stories, 26x75 feet, slag roof, hardwood floors, heating extension, electric light, metal lath, tile work. Owners will take sub-bids.

Residences (2), West Atlantic City, N. J. Architect, A. L. Brooks, Humphrys Building, Atlantic City, N. J. Owner, Benjamin Fox, 1102 Atlantic avenue, Atlantic City, N. J. Frame, brick, stucco, 2½ stories, 73x30 feet, slate roof, hardwood floors, hot water heat, electric light, tile work. Owner will build.

Garage and Service Station, East State street, Trenton, N. J. Architect, J. O. Hunt, Hunt Building, Trenton, N. J. Owners, Norman P. Druck Motor Co., 636 East State street, Trenton, N. J. Concrete, brick, steel, 2 stories, 190x60 feet, slag roof, concrete floors, iron stairs, metal partitions, fire doors, steel sash, electric light, blower system. Architect ready for bids.

Church (add.), Flemington, N. J. Architects, W. W. Slack & Son, Trenton Trust Building, Trenton, N. J. Owners, Presbyterian Church, care of Fred Jordy, Flemington, N. J. Stone, second story add., 30x50 feet, slate roof, hardwood floors, heating extension, electric light. Architects taking bids.

Residence, Wildwood, N. J. Architect, Christian H. Fries, Frankford and Oxford avenues, Philadelphia. Owner, Norman S. Neville, 9540 Bustleton avenue, Bustleton, Pa. Concrete block, stucco, 2½ stories, 30x42 feet, asbestos shingle roof, hardwood floors, hot water heat, electric range, refrigerator and laundry equipment. Plans about completed. Architect will be ready for bids in one week.

School, Woodlynne, N. J. Architect, A. B. Gill, 328 Market street, Camden, N. J. Owners, Woodlynne School Board, A. Cox, secretary, care of architect. Brick, steel, 2 stories, 38x72 feet, slag roof, maple floors, safety treads, roof ventilators, fireproof doors (heating, plumbing and electric separate). Architect taking bids due March 15th.

School (add.), Clayton, N. J. Architects, Ritter & Shay, Packard Building, Philadelphia. Owners, Board of Education, Borough of Clayton, N. J. Brick, reinforced concrete, cut stone, 2 stories and basement, 110x56 feet, wing 76x90 feet, slate and composition roof, maple and cement floors, hollow tile, roof ventilators, plumbing, waterproofing and damp-proofing, area gratings, ornamental iron work, bond, hollow metal doors and sash, metal lath, steam heat, electric light. Owners taking bids due March 24th.

Supplies, Camden, N. J. Owners, Purchasing Agent, H. P. Pelouze, P. O. Box 7241, Camden, N. J. Owners taking bids due March 15th, 11 A. M. Certified check, \$500, two 8-ton rollers. Specifications on file Room No. 6, City Hall, Camden, N. J.

Moving Dwelling, Haddon Heights, N. J. Engineer, J. J. Albertson, Camden, N. J. Owners, care of Borough Council, J. Cooper, president, Council Chamber, Haddon Heights, N. J. Owners taking bids due March 15th, 8 P. M.

Disposal Plant, Park avenue, along Pensauken Creek, Pensauken, N. J., \$65,000. Owners,

Pensauken Township, Pensauken, N. J. Incinerator plant, etc. Work contemplated.

Road Work, New Jersey. Owners, State Highway Commission, A. Lee Grover, secretary, Broad Street Bank Building, Trenton, N. J. Route 20, Sec. 7, Vineland to Malaga, Cumberland and Gloucester Counties. Excavation, double line reinforced concrete pavement, gravel shoulders, widening (2) small span bridges. Certified check, 10 per cent. Deposit, \$10. Owners taking bids due March 14th at noon.

New Jersey Contracts Awarded

Office Building, Pleasantville, N. J. Architect, J. T. Windrim, Commonwealth Building, Philadelphia. Owners, Delaware & Atlantic Telegraph & Telephone Co., Seventeenth and Parkway, Philadelphia. Brick, cut stone, reinforced concrete, steel, 2 stories and basement, 41x58 feet, slag roof, cement floors, plumbing, ornamental iron work, bond, metal lath, steam heat, electric light. Contract awarded F. W. Van Loon, Perry Building, Philadelphia.

Court House (finishing basement), Trenton, N. J. Architects, W. W. Slack & Son, Trenton Trust Building, Trenton, N. J. Owners, Board of Chosen Freeholders of Mercer County, Trenton, N. J. Terrazzo and woodoleum floors (plumbing and heating separate). Contract awarded to Thomas Day & Son, Day Building, Trenton, N. J.

School, South Pennsboro, N. J. Architect, Thomas Stephen, Temple Building, Camden, N. J. Owners, Board of Education of Winslow Township, A. C. Crowley, Pennsboro, N. J. Contract awarded to Watson & Schleinkofer, Ateo, N. J.

Laundry, Northfield, N. J. Architect, S. Hudson Vaughan, Guarantee Trust Building, Atlantic City, N. J. Owners, Atlantic County Board of Chosen Freeholders, Atlantic City, N. J. Fireproof, concrete, brick, steel, 1 story, 70x38 feet, slag roof. Contract awarded to John Green, Pleasantville, N. J., \$18,798. Plumbing to Benjamin E. Labov, 212 Adriatic avenue, Atlantic City, N. J., \$2,330. Heating to Baldwin Ventilating Co., 1509 Arch street, Philadelphia, \$2,997. Electric to Charles Miller, Humphry Building, Atlantic City, N. J., \$1,190.

Store (alts.), 601 Broadway, Camden, N. J., \$4,200. Architect, private plans. Owner, Sara P. Levy, 608 S. 6th St., Camden, N. J. New store front, steel work, general alterations. Contract awarded to John C. Gibson, 611 Bailey St., Camden, N. J.

Residence, 1294 Dayton St., Camden, N. J., \$4,000. Architect, private plans. Owner, George Szukalski, care of builder. Brick, 2 stories, 14x47 feet, slag roof, hot water heat, electric work. Contract awarded to John Witkowski, 21 Haddon Ave., Camden, N. J.

Building (add. and alts.), 1740 Fillmore St., Camden, N. J., \$3,500. Architect, A. B. Gill, 304 Market St., Camden, N. J. Owner, J. J. Dawson, on premises. Block, 1 story addition, 20x65 feet, slag roof, new store front. Contract awarded to Carl E. Widell, 39 S. 6th St., Camden, N. J.

Miscellaneous Construction News

Municipal Lighting Plant Building, Hagerstown, Md. Consulting engineer, L. T. Klauder, Bankers' Trust Building, Philadelphia. Owners, City of Hagerstown, Md. Owners will re-advertise for bids on revised specifications in a few days. Owners taking bids due March 15th at 7.30 P. M.

Road Work, Delaware. Owners, State Highway Department, Dover, Del. Contract 79, Maryland Line-State Road (widening, 9.908 miles. Excavation, cement concrete pavement, transverse expansion joint, Class "A" concrete gutter, wood shoulder curb. Owners taking bids due March 16th at 2 P. M. Certified check, 10 per cent. Deposit, \$2.

Mill Building, Flat Rock, Rd. 3731 feet, N. of Leverington Rd., Roxboro. Architect, private plans. Owner, Wm. Spink, on premises. Brick, steel, concrete 3 stories, 108x33, 75x30 feet, slag roof, plank floors, freight elevator, fire tower, steam heat, electric light, rolled steel sash, fire doors, rolling steel doors, wrought iron work. Plans in progress.

Miscellaneous Contracts Awarded

Mill Building, Greensboro, N. C. Architect, private plans. Owners, Samuel Pfingst and Frank Curran, Greensboro, N. C. Brick, steel, 1 story and basement, 100x200 feet, unit heat, electric light, Barrett roof, cement floors. Contract awarded William F. Lotz, Frankford avenue and Oxford pike, Philadelphia, who is taking sub-bids due March 10th.

Rectory, Wilmington, Del. Architect, George I. Lovatt, 225 South Sydenham street, Philadelphia. Owners, St. Peter's Pro-Cathedral, Rt. Rev. Bishop Fitzmaurice, Wilmington, Del. Brick, 3 stories, 40x100 feet, composition or tin roof, hardwood floors, electric light, tile work. Contract awarded J. E. Healey & Son, Wilmington, Del.

Residence, Westover Hills, Wilmington, Del. Architect, W. Woodburn Potter, Real Estate Trust Building, Philadelphia. Owner, Jasper Crane, care of architect. Hollow tile, brick veneer, 2½ stories and basement, 95x43 feet (heating reserved), electric light, metal lath, tile work, bond, ornamental iron work, tin roof, oak and pine floors. Contract awarded William Francis, Wilmington, Del.

Residence, Winston-Salem, N. C. Architect, Charles Barton Keene, 338 South Smedley street, Philadelphia. Owner, R. C. Shore, care of architect. Hollow tile, stucco, 2½ stories and basement, 130x45 feet, tile roof, oak and pine floors, metal lath, tile work, bond, ornamental iron work. Contract awarded Fogle Bros. Co., Winston-Salem, N. C.

Receiving Station, Clayton, Del. Architect, C. E. Wunder, 1620 Locust street, Philadelphia. Owners, Scott-Powell Dairies, Clayton, Del. Brick, 2 stories, 35x50 feet, slag roof, electric light, cement work. Contract awarded J. A. Bader, Wilmington, Del.

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., February 24, 1927. Sealed bids in duplicate will be received until 3 P. M., March 24, 1927, and then publicly opened, for furnishing all labor and materials and performing all work for the construction of the United States Post Office at Bayonne, N. J. Drawings and specifications may be obtained from the Custodian of the Site at Bayonne, N. J., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

We'll write your advertising without charge. All we ask is that you pay for the space and provide our ad. man with the necessary selling pointers.

(Continued from page 148)

one knows, is not a combustible material. Tests of steel at high temperatures have shown that up to a temperature of from 500 to 600 degrees Fahrenheit, steel in compression is about forty per cent. stronger than at ordinary temperatures.

From 700 to 800 degrees Fahrenheit—the temperatures which might be expected in ordinary fires—the strength of steel is approximately equal to its normal strength.

Tests conducted by the United States Bureau of Standards have shown that insulation by hollow tile, gypsum, brick, or similar materials, will enable a steel column to sustain its load even after from three to five hours of exposure to increasing temperatures ranging as high as 2300 degrees. Temperatures in excess of 2000 degrees Fahrenheit are reached only in the most severe conflagrations.

The use of steel, properly insulated, has played a notable part in checking the ravages of fire, but it still remains for us to define what properly constitutes a fireproof structural steel frame, for it is obvious that the necessity of protecting steel from the effect of high temperatures will vary in different parts of the structure and with the types of structure in question.

There is general recognition of the fact that the floor and roof panels do not necessarily require the same consideration in fireproofing that the skeleton frame proper should have. Insulation will always be requisite in a building filled with combustible furnishings. It is totally unnecessary in the great rotunda of the Pennsylvania Station in New York.

As for the determination of the best insulating materials, up to the present time it has been customary to rate the insulating qualities of a given substance in accordance with its thickness. Recent investigations indicate that the nature of the surface of the material has an important bearing upon its protective properties.

The American Institute of Steel Construction already has in preparation a definition of what constitutes a fireproof skeleton structure. Research should develop the use of lighter insulating materials in combination with greater air spaces. Such a development will reduce the dead weight imposed upon the frame, and lower costs to the benefit of the owner and the public.

The establishment and general acceptance of a unit of working stress for structural steel which will assure safe construction and the most effective use of the material is another matter deserving the active co-operation of all structural engineers desirous of placing at the disposal of their clients or employers the full benefit of their technical knowledge, skill and experience.

It has been evident to every structural engineer and architect that innumerable evasions have existed in connection with the use of the 16,000 pound per square inch working stress. These evasions have been prevalent in railroad bridge construction and in building construction where engineers of national reputation have found it advisable to use stresses sometimes in excess of 20,000 pounds.

The whole subject of working stresses for structural steel is one which furnishes a striking example of how practices, often unjustifiable, tend to freeze themselves so tightly into an industry that it takes years of thawing to get them out again.

It was about 1885 that steel first came into use as a building material. The first structural steel was made by the Bessemer process. It was a new and untried product. The 16,000 pound working stress was not formulated upon a knowledge of what steel would do. It was based upon the only possible foundation—upon experience with wood, stone and wrought iron construction.

Conditions changed. Bessemer steel began to give place to Open Hearth steel. The new process turned out a product of greater uniformity, greater strength, and greater ductility. Its grade was standardized by the specifications of the American Society for Testing Materials.

Steel became a thoroughly reliable material, but until a few years ago, when the American Institute of Steel Construction formulated its Standard Specification for the design and erection of structural steel, the 16,000 pound stress still governed the design of buildings in a large majority of cities in the United States and Canada.

The building codes of these cities, like the practices which they included, had become frozen and this freezing forced the engineer to use from ten to twelve per cent. more than the necessary amount of steel. It deprived the owner of the benefit of the engineer's skill and experience. Upon all operations in which steel was used it pressed a burden of unnecessary costs.

Fortunately this state of affairs is rapidly being remedied. At the present time all but four of the major cities in the United States have incorporated the Institute's Standard Specification in their building codes, or else are permitting its use. In two of these cities, Philadelphia and St. Louis, official committees have recommended the adoption of the Specification. The Specification is also widely used in Canada.

The 18,000 pound working stress, one of the most important features of the Specification, has been approved by leading engineers and architects on both sides of the U. S.-Canadian border.

Progress in the same direction is being made in railroad bridge construction where it has been the practice to design

structures on the basis of a 16,000 pound unit stress and an E 60 loading, but to immediately rate the bridge for service purposes on the basis of a unit stress of 26,000 pounds in tension.

Railroad engineers have frankly stated that due to this situation they have found themselves unable to side-step the humiliating task of explaining the obvious inconsistency when called into conference with their executives. In the past the railroad engineer has been obliged to provide for what he knew would be an increasing live load which had not yet been accepted by those in charge of operations.

These engineers are now taking the attitude that it is time to put all the cards upon the table and use materials at the stresses they can safely carry, thus discarding the fallacy inseparable from providing for a variable live load by using a low unit stress.

They have stated that as a result of the standardized practices formulated by the American Institute of Steel Construction, they will be able to prepare a specification that will entirely eliminate the out-worn practice now in vogue.

The problem of impact upon bridge spans is a phase of the same subject that has received consideration from a more or less empirical standpoint, based upon tests from which formulae have been proposed. There is, however, little agreement among engineers as to the best methods of determining impact.

The specifications now being written require that the influence of impact in the live load shall be converted into an equivalent static stress. It is certain that the stresses caused by the impact of the live load will result in a deflection of the structure in excess of that produced by the live load in a static condition. To meet the new requirements there should be a more uniform understanding than now exists.

Practically all the impact formulae in present use contain a factor corresponding to the square of the span, but none contains any factor representing the depth of the structure, unless there is assumed to be a constant ratio between the length of the span and the depth.

Among other influences which affect the impact are the speed with which the span is loaded; and, if it is a truss, the harmonic vibrations as the successive panels take the load. There is also the question of the unbalanced load in the driving wheels, and the nosing effect of a locomotive as it crosses the structure.

Excavating for foundations and dwelling construction offer additional field for improvement through the application of methods already in their initial stages of development, or awaiting discovery and formulation by the country's engineering brains.

Present methods of drilling and blasting for foundations are primitive as compared with the progress that has been made in other lines. Liquid air is now being experimented with in connection with the excavation of rock. It is known that through its violent evaporation it is capable of lifting tremendous masses.

It is possible that by the application of the oxy-acetylene flame we will be able to burn rock, reducing it to something like its original state of flux. This would enable us to drive a steel piling through hard pan as easily as we drive a wooden piling into mud.

Methods of residence construction have not kept pace with developments which have made the skyscraper the marvel of the modern age of building. In recognition of this lack of progress, plans were prepared some months ago for the erection of a "fault proof" house on Long Island.

The plans call for a steel frame, concrete foundation, brick walls, and gypsum floors. The object is to eliminate the many obvious faults in dwelling construction which for years have been accepted as more or less inevitable.

On it has been demonstrated that uneven settlement, sags in part, warps, crack, and fissures can be eliminated through the application of methods adapted from those used by outstanding skyscraper engineers, a powerful impetus will be given to better residence construction in this country. We will be a step nearer the fire-safe, waterproof, soundproof, and heat-conserving home.

Such a demonstration will afford one of the best possible checks to whatever tendency there may be to accept certain practices as fixed, and to declare such fixation to be the goal of engineering development. As engineers, we should be careful to distinguish between fixation and standardization. Fixation is the freezing in of methods whether good or bad. Standardization means the acceptance and universal use of only approved practices.

Fixation is retrogressive, or at least static. It holds no hope of progress. Standardization, elastic enough to permit the incorporation of new methods when change becomes desirable, is progressive. Standardization, as defined above, may with far more truth be said to be the real goal of the American engineer and American industry.

The valuable man in any business is the man who can and will co-operate with other men. The foreman who opposes the introduction of a new man into an institution and fights every innovation which he himself does not suggest, is doomed to a gradual and creeping defeat. Men succeed only as they utilize the services and ideas of other men. Co-operate!

SOME SUGGESTIONS FOR GOOD PLASTERING

By J. S. ELWELL

Successful plastering is more dependent on good work by other trades than is generally realized. It is difficult to impress on those outside the building trades just how dependent the plasterer is on the other mechanics and materials that enter into the modern house.

Many homes and apartments are, unfortunately, constructed with the idea of building at the lowest possible cost without regard to other considerations. This is not only poor economy, but has led to unethical practices, or at least low standards, on the part of many builders.

The Department of Commerce, Fire Underwriters and Municipal Building Departments all recognize this tendency and are trying to correct it by recommending or adopting codes and building restrictions designed to prevent the misuse of building materials.

In general, it is only on the largest jobs that the owner maintains efficient inspection. The ordinary job, even though designed by an architect or engineer, is usually left to the mercies of a contractor that has been forced into giving too low a bid by keen competition. Inspection or superintendence, if any, is limited to short, semi-occasional calls by the designer, which are devoted more to explaining or defending plans than to intelligent observation of the quality of the work under way.

As a general rule, we only get what we pay for, and this applies to the building industry more rigidly than to any other business. Reasonable construction can only be obtained by paying a reasonable price, and cheap or dishonest construction is generally a result of lack of understanding on the part of owners.

There is no single place where the results of good or bad work shows up as it does in plastering. If the general construction is neglected or skimmed either through ignorance or design, the results are shown by unsightly cracks or even by dangerous falling of the plaster. Some of the faults that may cause unsatisfactory plaster, without fault in the plaster itself, are:

Small or shallow foundations under posts or basement walls; too small sills or too few bearing posts; joists or studs too small or with too great a spacing; a single light joist under partitions (is not sufficient); improper or too light framing over wide openings; chimney not built independently of footings and frame; improper headers over door or window openings; rafters not tied and joists not braced; stud bracing neglected, especially at corners; use of green lumber (without allowance for shrinkage).

Any of the above are sure to produce cracks in a quick-setting plaster and even a slow-setting plaster which tends to adjust itself to minor movement, is not en-

tirely proof against such shortcomings. Plaster does not crack of itself except for two reasons, under-sanding and drying out too rapidly.

There are several causes that contribute to plaster failures, due to lack of knowledge or carelessness of the mortar man or the plasterer. With any plastering material, the mortar must be well mixed and the backing, wood lath, block, brick or concrete should be damp before it is covered. Wood lath should be of good quality and spaced far apart to insure good keys. Laitance must be removed from concrete and oil, dust and dirt from brick or block.

Whatever plaster is used, more than half of it, as it finally stands on the wall, is sand, just sand. The advantages of the various plasters are disputed at great length, but the quantity and quality of the sand receives little attention or thought. There are three things that would go far to insure better plastering if they were watched more closely.

First: Clean Sand

Second: Coarse Sand

Third: Measured Sand

More than a small (say five) per cent of clay, silt or organic matter is liable to cause discoloration or even disintegration. These defects may not show at first but sometimes develop after months or even years. Wall decorations, one twentieth of which were defective, would not be tolerated, and yet, that is just what dirty sand means. Why permit it?

Coarse sands usually make better walls than do fine sands. It is evident that the finer the sand the more surface there is to the grains in a given measure. No one would expect to paint a house with one gallon of paint, yet there are those who use very fine sand and expect their plaster material to cover unlimited sand areas.

Measuring the sand seems to be a very simple matter, but due to the effect of moisture it is most difficult. For example, take a cubic foot of dry sand, weighing about 100 pounds and add three pounds of water to it. Mix thoroughly and put it back into the original measure. It will be found that there will be almost one-third of the sand left over or about 30 pounds that will not go back into the measure.

Again, a No. 2 shovel of dry sand weighs about eleven pounds, while the same shovel with damp sand (about 3% moisture) will hold twenty-three pounds, or about twice as much.

Plaster specifications are written for dry sand and allowance must be made for moisture content. Experience has shown that the shovel measure is as reliable as the box method but either must be corrected, for all sands as used on the job contain some moisture.

As the cementing material is only to bind grains of sand together, it is most important that the proper amount of

clean, well-graded sand be thoroughly mixed with the plaster.

In conclusion, use only the best lath, spaced not less than $\frac{3}{8}$ inches apart with broken joints every seven or eight lath; nail securely on studding not over 16 inches apart, and see that the lath are wet down.

Use only clean, coarse, well-graded plastering sand in the proper amounts, and see that all solid backing is clean and not bone dry.

Hire good mechanics and pay a fair price.

Sound and heat proof walls, built of a porous and not too rapid setting plaster, are warmer in winter and cooler in summer.—*Building Age and National Builder.*

The other day a prominent local architect called up to inquire regarding a concern that has not advertised with us for two years. "I saw their ad. some years ago in the Guide," said the architect, "and am unable to recall just where they are located." We gave him the address and learned subsequently that as a result the firm bagged a big order. How many similar orders, from architects who wouldn't take the trouble to look them up, that same concern has missed in the course of the past two years it would interest us to know.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soul with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

The only road to advancement is to do your work so well that you are always ahead of the demands of your position. Our employers do not decide whether we shall stay where we are or go on and up; we decide that matter ourselves. Success or failure is not chosen for us: we choose them for ourselves.—H. W. Mabie.

To be poor in a wealthy country, to be sick in a good climate, to be inefficient among a progressive people, is a sign of unwise educational methods. Such people were not taught to battle with the world or meet life's emergencies.—Thoreau.

Ideals are like stars; you will not succeed in touching them with your hands. but like the seafaring man on the desert of waters, you choose them as your guides. and, following them, you reach your destiny.—Carl Schurz.

"ANTI-HYDRO" Keeps These Cellars Permanently Dry

One of a Group of Houses at Malba Estate
Malba, Long Island, N. Y.

Architect, Harold E. Padden
Contractor, Arthur Waldron

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation*.

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-three years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

Compo-Board

REG. TRADE MARK

Successfully used for walls and ceilings for over thirty years.
Insulates. Takes any decoration. Will not warp.

"THE YARD WITH THE STOCK"

In Placing a Contract—

The following are often disregarded in
grasping a cheap price:

Years in business,
Experience in this class of work,
Standing in the Community,
Personal references,
Financial Rating and Credit Standing,
Reputation for fair dealing,
Possible reciprocity,
Organization and personnel in back of contract.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

AVERAGE CITIZEN BREATHES FIVE TIMES WEIGHT IN SOOT

Air Conditioning of Buildings Vital to Health in Reducing Menace of Smoke Nuisance

The average American breathes more than five times his own weight in soot and dirt every twelve months.

That's the conclusion of Claude A. Campbell, Toledo banker, who for years has been nationally identified with organized efforts to combat the smoke nuisance in American cities. More than six per cent of the air the average citizen in the average American city breathes is loaded with the soot of coal, Mr. Campbell pointed out, while the national dumping of soot and dirt from smoke reaches 70,000,000 tons every year.

Mr. Campbell was formerly president

of the Ohio Association of Building Owners and president of the Toledo Association of Building Owners and Managers. He is an officer of the National Association.

"Aside from the tremendous economic loss caused by the promiscuous damaging of property, the smoke nuisance is taking a huge toll of American life," Mr. Campbell declared. "Many Americans are literally breathing themselves to death because of the pollution of the air of American cities by smoke and other sources. The fact that in Toledo, which is typical of the average American city, every citizen is allotted on a per capita basis, 2 3-5 pounds of soot per day, is significant, in view of the fact that air conditioning tests conducted by federal agencies show that the average person breathes 43 1-5 pounds of air per day.

"Reducing the amount of air pollution by smoke is not only a question of striking at its causes by forcing the use of improved methods, but becomes an issue of scientifically treating air in homes, offices, factories, schools and public buildings for the protection of the public health. Control of temperature and humidity is important, but cleanliness of the air and constantly changing it is as vital. Nine million office workers are bending over desks and sixteen million industrial workers are sweating in factories that lack the clean air and proper ventilation so essential to health and efficiency. Clean, wholesome air, vitalizes the body, but its opposite cuts efficiency down as much as 50 per cent, scientific tests have shown."

Mr. Campbell's investigations revealed that coal on an average is only 60 per cent efficient. Between 10 and 20 per cent goes up the chimney in soot and a part of the balance drops into the pit as ash. He thus figures, on average consumption, that more than seven carloads of soot are dumped every day on the average city of about 300,000 population.

"The smoke nuisance and the provision of treated, conditioned air within buildings have many ramifications. The percentage of murders and other crimes are hidden in notoriously smoky cities. It brings bad morals. Physicians of the public health service have found that the denser the smoke content of the air the higher is the pneumonia rate. Smoke and air conditions have a direct bearing on pneumonia, which is rampant this time of the year. Authorities estimate that the loss by reason of smoke and soot to Cleveland is \$6,000,000 per year; Cincinnati, \$8,000,000; Pittsburgh, \$10,000,000 per year; Chicago, \$50,000,000 and the United States in excess of \$500,000,000. Smoke and soot costs large department stores from \$20,000 to \$50,000 per year; hospitals from \$5,000 to \$20,000; hotels \$8,000 to \$25,000; office buildings from \$10,000 to \$30,000. These figures were compiled by three universities.

"Mr. Campbell directed attention to an investigation and report just completed by the health commissioner of Baltimore which shows that 1,530 tons of matter settles out of the air per square mile of surface in that city during a year while yearly precipitation of soot per square mile in other cities are as follows: London, 426 tons; suburb of London, 58 tons; Leeds, England, 529 tons in the industrial section and 26 tons in the residential section; Pittsburgh from 595 tons to 1,950 tons; St. Louis, 600 tons; Cincinnati, 500, and Cleveland, 700. This health commissioner pointed out that besides the bad effect on health the heavy pollution of the air costs each householder from \$12 to \$17 a year for extra cleaning, laundry wear and deterioration of materials.

"The amount of soot and dirt consumed by the average person, however, depends considerably on the amount of time he spends inside and the manner in which the air in his office or home is conditioned, Mr. Campbell pointed out. The average American spends perhaps two-thirds of his time indoors either working or sleeping. The soot he breathes, the percentage of his daily allotment of 2 3-5 pounds that he actually takes into his system, depends considerably on the quality of the ventilation he lives in.

"We have no quarrel with coal," Mr. Campbell said. "Coal is one of the basic necessities. We are concerned, however, with the way in which coal is wasted, the pollution of the air of our cities and the remedy. Boilers can be made more efficient, smoke consumers can be installed without much extra expense. Smoke is waste. More of the potential fuel in smoke can be consumed. Almost every city has its anti-smoke ordinances. They should be enforced. The smoke nuisance can be controlled. We have the right to demand clean air."

AS IT IS DONE IN CHINA

Building Contractors in Wusih.—There are about a thousand building contractors and firms of contractors and masons in the district of Wusih. They are divided into two classes, "Large Contractor" and "Small Contractor." The former is a main contractor and the latter is a sub-contractor in building construction work. On June 16, the festival day of Lupan, the god of the craft. Wusih contractors representing the two classes held a meeting to pass the following new regulations:

(1) Wages paid by the owner of the contracted buildings to carpenters and masons will be \$0.55 per day, \$0.05 to the building contractor as his business expenses, and \$0.12 to the workers for noonday meals and the remaining \$0.38 to the laborers for wages per day. The wages for occasional work will be \$0.60 per day.

(2) Working hours of carpenters and masons will be: From Arbor Day to the 9th day of the 9th Moon from 9 A. M. to 6 P. M. From the 9th Day of the 9th Moon to Arbor Day from 9 A. M. to 5.30 P. M.

(3) Supper will be supplied by the contractors. But after 8 P. M., carpenters and masons must provide their own evening meal.

(4) Costs for constructing buildings and for interior decoration work, etc., must be estimated on a fair basis. No contractor is allowed to contract for excessively low costs in order to obtain the work. Too keen competition should be avoided because it is useless to obtain business which the contractor cannot complete.

(5) Besides the cost of material and labor, owners of contracted buildings are required to pay extra charges for plans, measurements, transportation of materials, rope, etc. The additional charge will be \$0.05 per \$1, calculated according to the total cost of the buildings contracted for.

(6) Owners may have a free opportunity in comparing costs submitted by any contractor. If the contracted cost by the first contractor is the same as that submitted by other contractors, the first contractor shall obtain the business. If any contractor gives a lower estimate of the cost than the first contractor, and when he actually gets the contract, that contractor is obliged to pay to the first contractor such charges incurred in preparing the plans and in making out the estimates, etc. The charges will be calculated according to the total cost contracted for, at the rate of \$0.005 per \$1.

(7) Any contract supplied by the contractors must be guaranteed by the shop of the Contractors' Guild. If the contractor fails to complete the work, the Guild will be responsible for making good the contract without extra payment from the owner.

(8) Contractors are obliged to pay to the Guild as contribution \$0.03 per \$1 when new contracts for \$1,000 or above are obtained.

(9) When a contract has been signed, no other contractor is allowed to try to obtain this business.

(10) If, owing to certain special causes, work is suspended before its actual completion, no other contractor is permitted to continue on the work if payment by the owner for the part completed has not yet been settled.

(11) No laborer is allowed to be employed by other contractors when his work with his present employers is not completed.

(12) No employee of the contractor is allowed to obtain business supposed to be the contractor's.

(13) The establishment of new firms of

carpenters and masons must be reported to the Guild. New shops are required to pay an entrance fee of \$10 to the Guild.

(14) Contributions to the Guild from shops in towns and villages outside the city should be sent to the Guild direct and an official receipt obtained.

(15) Five committeemen should be elected among the members every year to look after the public fund belonging to the Guild.

(16) Sick carpenters or masons will be looked after by the Guild, provided the fund is sufficient for the purpose.

(17) A fund will be raised by the members to erect a Guild building.

(18) The above regulations are to be strictly obeyed by the trade. Fines will be decided by the majority of the members if any member disobeys any rule.

REMOVAL OF STAINS FROM MARBLE*

Various kinds of accidental stains may be encountered in marble in its different uses and generally each particular type of stain requires a special treatment. It is not always possible to determine what the staining matter is and in such cases the treatment has to be largely experimental. A great variety of chemicals may be applied to marble without appreciable injury, but acids or those chemical solutions which develop an acid condition should usually be avoided or used judiciously. However, the serpentines, commonly called verds antique marbles, are of such composition that they are not appreciably affected by acids and hence, this class permits a wider variety of treatments.

Usually stains cannot be readily removed by merely applying the proper chemical to the surface or by scrubbing the stained part. This is due to the fact that stains penetrate to some degree and cannot be reached by the mop. In general it is necessary to resort to a poultice or bandage. By a poultice is meant a chemical mixed with a fine inert powder and water, or some other liquid, to a pasty or mortar consistency. This is applied to the stained part of the marble with a brush or trowel to form a layer of considerable thickness. The bandage treatment consists of soaking a layer of cotton or several thicknesses of cloth in a chemical solution and pasting this over the stain. In some cases the poultice is preferable and in others the bandage is better. Both serve to hold the chemicals in place for several hours without drying out. This prolongs the action of the solvent and as the solvent evaporates the dissolved matter is drawn out into the poultice or bandage. Some stains can be removed with one application of the poultice or bandage while others require several repetitions. In many cases of badly neglected marble which have become stained almost beyond recognition it is surprising how well they can be cleared up and brought back to the original appearance. Methods of treating various stains will be discussed separately.

*Department of Commerce, Bureau of Standards, Washington, D. C.

tice or bandage while others require several repetitions. In many cases of badly neglected marble which have become stained almost beyond recognition it is surprising how well they can be cleared up and brought back to the original appearance. Methods of treating various stains will be discussed separately.

Iron Stains

This is a common type of stain on marble and can usually be recognized by its resemblance to iron rust or by its position with respect to adjoining iron work. Two methods have been found which are effective in removing this type of stain, one of which is slow and has no injurious effects and the other is fairly rapid but has a slight etching effect on the marble. The first of these is as follows:

Formula No. 1

Dissolve 1 part of Rochelle salt or sodium citrate in 6 parts of water. Add to this an equal volume of glycerin and mix thoroughly. Stir into this enough whiting or marble dust to make a paste just stiff enough to adhere in a thick coating to the marble. Apply this to the stained marble with a trowel or putty knife. This will remain tacky for a few days, but when it becomes dry it should be removed and replaced by a new layer. Usually this process will have to be repeated several times to remove the stain. This is a perfectly safe treatment and in some cases it may be found preferable to the more rapid treatment.

Formula No. 2

Materials required: Sodium citrate, sodium hydro-sulphite ($\text{Na}^2\text{S}^2\text{O}^4$) and whiting. Sodium citrate can be obtained at any chemical supply house, whiting from a paint store, but the hydro-sulphite may have to be ordered from one of the following firms:

J. T. Baker Chemical Co., Phillipsburg, N. J., or from the following under the trade names indicated:

"Burmol"—R. I. Street Co., 28 N. Clinton St., Chicago, Ill.

"Sulphogen"—Riverside Mfg. Co., Arcade Bldg., St. Louis, Mo. Dissolve 1 part of sodium citrate in 6 parts of water and apply this to the stained marble or better saturate a white cloth in the solution and paste it over the stain until ready to apply the hydro-sulphite. The latter consists of small gray crystals a little coarser than table salt. If the stained marble is in horizontal position sprinkle a thin layer of the hydro-sulphite crystals over the stain, moisten with a few drops of water and cover with a thick paste made of whiting and water. If the stain is on a vertical face of marble the whiting putty can be applied first a little below the stain and hollowed out slightly to hold the hydro-sulphite powder. Then work the putty and the hydro-sulphite up until the stain is covered. Leave this on the

stain for about an hour and remove. If the stain is not entirely removed repeat the operation. Unless the stain is deep, one treatment will usually remove it. This treatment is apt to dim the polish somewhat due to a slight etching effect. However, it is not a difficult matter to repolish the treated portion with a piece of chamois and some putty powder which can be obtained from a marble setter. Moisten the chamois, dip it into the dry putty powder and rub the marble vigorously until the polish is obtained.

Tobacco Stains

Tobacco stains may produce an unsightly appearance on marble but their removal is not difficult. If any of the grit scrubbing powders, commonly used on marble or tile floors are at hand such will usually be found satisfactory for application in the form of a poultice. Stir the powder into hot water until a mortar consistency is obtained. Mix this thoroughly for several minutes, then apply it to the stained marble in a layer $\frac{1}{2}$ -inch or more in thickness. Leave this on until dry (24 hours at least) and remove. Repeat the treatment if necessary.

If the scrubbing detergents are not at hand the following formula may be used: Shave about 1 cubic inch of soap into 1 quart of hot water and stir until dissolved. In another vessel dissolve 1 large tablespoonful of soda ash or 2 of washing soda (sal soda) in 1 pint of water. Add this to the soap solution and mix the two thoroughly. Scrub the stained marble with some of this mixture on a soft cloth for two or three minutes to remove the surface stain and soak the marble. A poultice is then made with whiting or powdered talc 4 parts, corn starch 1 part and enough of the soap solution to form a thick paste. Apply this to the stain in a layer $\frac{1}{2}$ -inch thick and leave on 24 hours. Repeat if necessary.

Ink Stains

Ordinary writing ink usually consists of gallotannate of iron, a blue dye, a mineral acid, phenol and a gum or glycerin. Such an ink etches the surface due to the acid content, the dye penetrates, some of the gallotannate penetrates but is most precipitated at the surface. The stain, especially if an old one will require one treatment to remove the dye and another to remove the iron. The first may be treated as follows. Make a saturated solution of sodium perborate in water. Mix this with whiting to form a thick paste. Apply it to the stain in a thick layer and leave it until dry. If a brown stain remains it should be treated with Formula No. 1 or No. 2 for iron rust. Sodium perborate can be obtained from any druggist.

Many of the red, green, violet and other bright color inks are water solutions of synthetic dyes. Such inks contain no

acids and do not etch marble. Stains made by such can usually be removed with the sodium perborate treatment given above. Small stains of this type of ink can often be removed with ammonia water. This may be used by soaking a piece of cotton in the ammonia water and laying it over the stain for a few hours. Javelle water may be effectively used on such ink stains and in some ways it is preferable. This can be applied like the ammonia water or mixed with whiting and applied as a poultice.

A mixture of 1 part of chlorinated lime and 1 part whiting mixed to a stiff paste with water may also be used as a poulticing material for this type of ink stains. Chlorinated lime can usually be obtained from any drug store, but Javelle water on account of its unstable nature, is not always easy to obtain.

Some blue inks contain Prussian blue which is a ferrocyanide. Such colors cannot be removed by the perborate treatment, Javelle water or chlorinated lime paste. Ammonia water or a soap solution will remove this color.

India ink consists of a finely divided carbon held in suspension in a liquid by gums, shellac, etc. The carbon does not penetrate marble, but some of the minute particles may lodge in the uneven parts of the surface and be very difficult to remove. Carbon is entirely insoluble so chemical treatments are of no avail. If a vigorous scrubbing with soap does not remove all of the carbon from the surface it will be necessary to use a mild grit and grind away part of the surface. If a rough spot is left by this treatment it may be repolished as described under formula No. 2 for iron stains.

Indelible inks often consist of dyes and the stains from such may be treated as those from bright colored inks referred to above. Some indelible inks contain silver salts which turn black. A stain of this kind may be removed with strong ammonia water, but the action is slow. Saturate a piece of cotton in the ammonia water and place it over the stain for several hours.

It is noted that the fluctuation of construction costs during the past 18 months has been within a comparatively narrow range. A scale which has the 1913 average as its base shows the highest level reached during that period to be 199, the February mark. The lowest point since midsummer of 1925 was 195, reached in October of last year.

The average of wages rose two points during February to reach the mark of 227. The lowest position held by the average of wages during the past three years was 219, the mark being registered in January, 1924.

The average of prices paid for basic building materials rose two points, dur-

ing February, reaching the 181 level, the position held one year before. The figures for February, 1924, and February, 1925, were 192 and 188, respectively.

Construction activities decreased slightly during February, according to statistics compiled by the Associated General Contractors of America. Despite this condition, however, a new February record was set, the figure last month being a trifle above the previous high mark, which was set in February, 1925.

Figures for the first two months of the year show construction operations now to be lagging behind the activities of the first two months of 1926, the year during which all records were broken. The situation was brought about by the decline during January, which the higher February total was unable to offset.

Taking into consideration the season of the year, observers are attaching no particular significance to the January decline of the new February record. It is pointed out that 1924 saw a great January-February volume of construction carried on, and yet the total for 1924 as a year stands below the marks set in each of the two succeeding years.

The index number for the February volume, carried on a scale which has the 1913 average as its base, was 121. This volume is 6 per cent. smaller than the January figure. The volume of the January and February operations was $1\frac{1}{2}$ per cent. smaller than that recorded for the first two months of 1926.

There is not a business one can think of, which is not full of little temples where one can curse or pray. Every business that one knows has its host of light in it, fighting against its host of darkness; one set of men conducting the business as if they and the public were engaged in a sort of mutual enthusiasm and daily service, with permanent success as the goal; and another set of men whose success is ruining the business to which they belong, and the public besides—and themselves.

An old legend tells of a magician's vase; the magician could get out of it only that which he put in. Advertising is just that. If you don't get into it the "kick" of salesmanship, it is going to miss by just that much the pulling power it ought to have.

When you stop to consider that the Guide reaches every week and is read by architects, builders, building owners, contractors and sub-bidders in every branch of building construction, you must perceive its unique importance as a medium for advertising with an appeal to that class. Every copy reaches a live prospect.

"ANTI-HYDRO" Keeps These Cellars Permanently Dry

The houses at Malba Estate are built on "springy" ground, but the cellars of all of them are always dry, because the concrete foundations, walls and floors are permanently waterproofed with "ANTI-HYDRO."

No matter how large or small your job may be, you will find "ANTI-HYDRO" the most satisfactory as well as the most economical concrete waterproofer and hardener you can use. It both hardens and waterproofs in *one operation*.

"ANTI-HYDRO" is a liquid integral compound which mixes easily with the gauging water—any unskilled laborer can do it. Twenty-three years of successful use is your guarantee of satisfaction when you use "ANTI-HYDRO." Try it on your next job for permanence.

As The Editor Sees It

THE SWISS CHALET

By H. A. SIMONS

Perhaps the Swiss chalet would take its place among the residence-styles adapted to the uses of present-day American families if it were not so generally believed that it is a type of design peculiarly adapted to a mountainous country. This belief comes from the fact that the typical chalet, as we are familiar with it, has an extremely flat roof with wide projecting eaves.

But this is only half-true. In the higher parts of Switzerland the roofs are of this type—for a reason that may not be overlooked. There, snowfall is heavy; a nearly-flat roof holds the snow, and this helps to keep the house warm, because a thick blanket of porous snow is an excellent insulator. But in many parts of the country, particularly the valleys, there is more rain than snow; and there we find roofs as steep as those of our own New England Colonial farm-houses.

So an American owner who chose to adapt the Swiss Chalet to the purposes of his home could have a roof of any pitch he pleased, any degree of steepness that seemed to "fit into the landscape." But this must be remembered, too: the high-

pitched gable roof no longer is universally in favor among us.

In our adaption of the Spanish and Italian styles, we frequently build flat roof-decks above short slopes, whether the site is in hilly country or flat. So on this score there really is no reason why the Swiss style should not be used.

In the older chalets, built two centuries ago and still standing, the principle of construction is exactly that of the pioneer American log cabin. Hewn timbers are squared down, and are notched near the ends to fit into each other. They are cut to fit tightly and smoothly together, without the chinking of the cracks which was necessary in the typical log cabin. Partitions are built in the same way, the timbers for them being notched and fitted into the side-walls during the erection of the latter. Over such walls and partitions, simple trusses are erected, wooden purlins are stretched and covered with roof boards, the surface being tiles or shingles or slates.

This principle, employed by the Swiss builders centuries ago, remains the basis of chalet-construction today. But the modern chalet usually is factory-built. Every timber in it is cut to exact dimensions and marked. Then the whole thing

is shipped "knocked down" and is erected on the building-site. Many chalets are fabricated this way for shipment to all parts of the world.

But here we learn another fact about Swiss dwellings which is not generally known. There really are three Switzerlands, one where German is spoken, another dominated by French traditions and culture, the third subject to Italian influence. It is in the German part of the country that the all-wood chalet prevails most extensively and is found at its best. In the Italian regions, especially, masonry chalets covered with stucco are found in large numbers.

And this is another fact that lends the chalet to American adaptation. Though it is, essentially, a wood style, it may be built, perfectly properly, of any type of construction.

Now let us get down to the concrete facts about chalet-construction and design, and, first of all, the plan. The chalet may be of any height, from one story to three. Perhaps the most general type, among the better-class dwellings, consists of a full-depth basement above ground, surmounted by two full stories plus a half-story under the roof. The basement-walls usually are of masonry.

831 South 49th Street, Philadelphia

In many cases the basement is omitted, and the house is built upon stilts. At the top of the stilts, just below the sill, are great wide flat stones; and the steps leading up to the living-quarters are such that they can be raised from the ground when not in use. The explanation of these peculiarities is that they keep out rats and field-mice—on the same principle that dwellings in jungle-countries are set on poles for protection from reptiles.

Whether the house is one or three stories high, each story is divided into two, three or four simple rectangular rooms. This characteristic of the plan is dictated by the form of construction, by which the partitions are fitted into the side-walls. Where, as in the case of a public-house or inn, additional rooms are desired, simple board partitions are added to the main partitions of heavy timbers which divide each floor into halves or quarters. But the standard arrangement may be regarded as a living-room extending across the entire front of the main floor, with the rear half divided into a kitchen and dining-room, and the upper story or half-story quartered into four bedrooms.

Another peculiarity of the Chalet is that the entrance usually is at one of the rear corners. This gives into a little vestibule, which generally opens into the kitchen. The vestibule is a stair-well with narrow stairs leading to the upper stories.

One more fact about the plan: The American householder wishing a built-in garage may extend the wide eaves outward and downward to cover it; for many Swiss homes are built like this to accommodate a wagon-shed or a granary or a wood-shed on one side.

Roofs, as we have seen, may vary greatly in pitch. They may be of virtually any material, also. Red pan-tile, blue-grey slates and natural-colored shingles, all are employed in Switzerland. If a roll-roofing is put onto an American adaption of the chalet style, it should be low-toned and not too variegated in color.

Chimneys play an insignificant part in the design of the Swiss dwelling. Most of these homes are heated by peculiar tile stoves, though of late years sheet-iron stoves and even the old-fashioned cozy "base-burners" have been introduced. Hence, there may be two or three chimneys jutting above the chalet-roof, but they are little and, though they may be capped by odd-shaped hoods, they are rather inconspicuous. Certainly the chimney must not play the dominating part in the design of a chalet that it may

—indeed, must have in the English cottage.

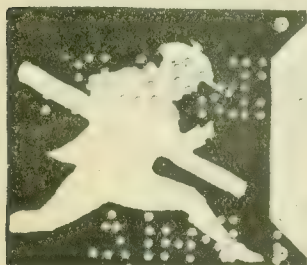

In masonry types of construction, we are likely to find windows of various sizes placed somewhat haphazardly in the walls. This is possible, because masonry materials come in small units and it is just as easy to lay them with a void in one place as in another. In the chalet, however, we are dealing with large timbers, which are much less flexible in design. So we find that doors and windows are rather small, invariably rectangular, tending to be uniform in size and orderly in arrangement.

There usually is a row of small windows in each story, running all or nearly all the way round the house. They are not always spaced exactly the same distance apart, but there is a definite balance and symmetry in their placement. They are glazed with small panes, either leaded or held by wooden muntins. The windows invariably are covered with shutters. Sometimes these are grooved and set into slots, so as to slide back. Again, the shutters are hinged at the top so that, when opened and propped up with little rods, they resemble little awnings. The shutters often are carved and pierced with openings of fantastic shape, and they supply one of the few color-notes on the exterior of the chalet, being of a bright green against the rich dark brown of the oiled wood forming the main part of the elevation.

Attic-windows and the windows in the dormers of the houses that have steep enough roofs to permit of dormers are the only exceptions to the rule that Swiss windows are rectangular in shape. Doors often are beautifully carved, paneled or moulded. Door and window hardware is of remarkable beauty in Switzerland. Strap-hinges, knockers, handles and escutcheons are hammered out of iron by the village smith during the long winters, while the prospective home-owner is carving the wooden ornamentation for his home.

This carved-wood ornament is used chiefly on the balconies. No Swiss chalet but has a balcony—or three or four balconies—on some part of its exterior. It may extend all the way around one story; or there may be a balcony at each story-level on the front elevation only; or a second-story balcony protected by the extremely wide eaves of the roof and, in turn, giving protection to the windows below, may project out from the upper floor, or the eaves may extend far down

Proposal

TREASURY DEPARTMENT, Office of the Supervising Architect, Washington, D. C., March 15, 1927. Sealed bids in duplicate will be received until 3 P. M., April 19, 1927, and then publicly opened, for furnishing all labor and materials and performing all work for the construction of the United States Post Office at McKees Rocks, Pa. Drawings and specifications may be obtained from the Custodian of the Site at McKees Rocks, Pa., or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

(Continued from page 180)

on one side to cover the granary or woodshed and on the other side to give a partial enclosure to a balcony there.

There is an infinite variety to the treatment of the balcony in the Swiss chalet; but the feature is well-nigh universal—and it should prove adaptable to American living-conditions, in the form of a sleeping-porch or a sun-room.

These balconies generally are covered with wood-work so fine as to be called "wooden lace." Many times it consists of long carved boards applied horizontally. Again, it consists of an elaborately carved series of balusters. Still again, the railing is built of flat boards pierced by scroll-work done with a saw. The unlimited ingenuity of the Swiss wood-carvers spends itself in the elaboration of this beautiful work, and it is applied prodigally to the balconies, to the bargeboards on the eaves, and to the corbels, brackets and struts that support the balconies.

So now we have a completed picture of the chalet exterior: rather low it is, though not necessarily squat, with the horizontal line predominating over the vertical, this movement emphasized by the broad eaves and the balconies, low-toned in color except for the bright green shutters and the flower-pots that fill every window, extremely simple construction, given a feeling of rich but unpretentious beauty by the carver's handicraft.

The Swiss are not a rich people. So we must not look for any elaborate interior decoration within their little homes. Here, again, the only means they have of adding beauty to their surroundings is their craft skill; the richness of the interior wood-work even exceeds that of the exterior.

The floors are of hard-wood—in the cases of the well-to-do, finely laid parquetry. These are covered with rather ordinary rugs.

Walls are paneled with oiled or dark-stained wood. The panels consist of rather wide boards, chamfered or beaded along the sides and applied vertically.

Only in the ceilings is color introduced extensively. The roof rafters or floor joists are left exposed, and these sometimes are carved, but more often are just smooth and chamfered and painted with simple but attractive designs in strong colors. Against this simple background are placed pieces of furniture wrought by hand.

Announcement was made recently of the details of the nation-wide architectural competition for the best designs for a residence and garage built principally of wood, with \$3,500 in cash awards offered by C. W. Stimson, prominent Seattle lumberman and the West Coast Lumber Bureau.

This contest is sponsored by and conducted under the auspices of the Washington State Chapter American Institute of Architects and is known as the "West Coast Woods Architectural Competition."

It is open to any architect, architectural firm, designer or draftsman.

J. Lister Holmes, A. I. A., of Seattle, has been selected as professional adviser and architects composing the committee on competitions for the state chapter are: Harlan Thomas, chairman; J. Lister Holmes, vice chairman; William J. Bain; David J. Myers and Robert F. McClelland, all of Seattle, and Nelson J. Morrison, of Tacoma.

The competition will close at 5 P. M. on August 1, 1927, and the first prize design will receive \$2,000 in cash, the second prize \$500 and ten designs receiving favorable mention will be awarded \$100 each.

The program of this competition provides that the subject of the design shall be an attractive all-year-round residence and garage, built principally of wood, the house containing not more than seven principal rooms confined, with the garage, to an immediate site of 12,000 square feet. The garage may either be a part of the house or detached. The plans shall be convenient in arrangement and adapted to general living conditions.

The jury of award will consist of five architects of national repute selected from representative sections of the United States. The program of the competition provides that the jury of award shall give consideration to the following points:

"1. Novelty and originality in the treatment and use of wood native to the Pacific northwest.

"2. Excellence and ingenuity of plans.

"3. Architectural merit of the design and fitness of the application to a frame house.

"4. Practicability of construction.

"5. Fitness of the design as a whole to meet the needs of the problem."

Excellence of drawings also will be given consideration by the jury, but will rate a small percentage in proportion to the other points. The competition will be conducted under the code of the American Institute of Architects. "The special purpose and intent of this Competition," according to the statement of the committee of architects in charge, "is to develop and bring forth the uses, applications, and methods of construction and finishing of the woods of the Pacific Northwest. Douglas Fir, West Coast Hemlock, Sitka Spruce and Western Red Cedar. It is the thought of the Bureau that the methods of use and the beauty in treatment of these woods has as yet been merely touched upon and that applied ingenuity will bring forth new and effective developments, both in using and beautifying these products. It is hoped that the most competent architectural designers will be encouraged to bring their talent to bear in ingenious ways towards most artistic results."

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

The Car Skidded

And then someone discovered that his broken window or smashed fence was his dearest possession and put in a bill of damages to prove it.

And the automobile owner paid—because his insurance didn't cover damage to the property of others.

Your agent can get you automobile policies covering property damage, collision, public liability, fire and theft. How well are you insured?

"ANTI-HYDRO" Made the Leaky Walls and Pits in this Post office Waterproof!

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement plaster coat mixed with "ANTI-HYDRO" was applied to the *inside* of the walls and pits. Now they are absolutely and permanently waterproof.

There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO." It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent.

Use "ANTI-HYDRO" on your next job. For over 23 years it has been specified by leading architects, engineers and contractors.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

M., April 13, 1927, for construction of new floor over light-well, etc., in mezzanine of United States Custom House and Post Office, Allentown, Pa. Drawings and specifications may be obtained from the Custodian of the building, or at this office, in the discretion of the Supervising Architect. Jas. A. Wetmore, Acting Supervising Architect.

BUILDING OPERATIONS IN FEBRUARY SHOW GAIN OVER JANUARY

The volume of building operations in Pennsylvania during February, 1927, showed an increase of 20.6 per cent. over January, according to reports received at the Department of Labor and Industry from building inspection offices in 36 cities and boroughs. Compared to February, 1926, however, the reports for 36 cities and boroughs show a decrease in building operations of 10.3 per cent. The number of permits granted in the 36 cities and boroughs during February, 1927, totaled 2,799 and covered building

*Number of permits—buildings not given

operations estimated to cost \$12,564,642. Of this total \$10,646,086, or nearly 85 per cent., is to be expended for the construction of new buildings and the remaining 15 per cent., or \$1,918,556, is to be used for additions, alterations, or repairs to buildings.

The reports of 25 of the 36 cities and boroughs for which comparable records are available, show increased volume of building over February of last year. These localities and their respective amounts of gain over February, 1926, are the following: Allentown, \$590,200; Berwick, \$8,800; Bethlehem, \$32,820; Bradford, \$19,530; Bristol, \$52,320; Coatesville, \$27,950; Donora, \$22,500; Duquesne, \$17,681; Easton, \$71,882; Harrisburg, \$42,559; McKees Rocks, \$47,000; Meadville, \$151,025; Monessen, \$143,460; New Castle, \$75,795; Oil City, \$5,790; Potts-

ville, \$24,655; Scranton, \$161,260; Sunbury, \$2,785; Uniontown, \$40,740; Warren, \$36,850; Washington, \$15,560; Wilkes-Barre, \$72,263; Wilkesburg, \$111,050; Williamsport, \$162,500, and York, \$43,020.

Among the eleven places showing losses in building over February, 1926, are included six large cities of the State. These six cities and their per cent. of loss are: Altoona, 17.6 per cent.; Harrisburg, 70.3 per cent.; Lancaster, 61.9 per cent.; Philadelphia, 22.5 per cent.; Pittsburgh, 7.2 per cent., and Reading, 4.2 per cent. The loss in Philadelphia, amounting to more than \$2,000,000, may be partly attributed to high totals in February, 1926, due to the issuance of permits for Sesquicentennial buildings and for two high school buildings. A permit for the construction of a \$750,000 office building

was granted in Reading during February, 1926, which accounts for the greatly reduced total in Reading this year.

The types of buildings to be constructed under the February permits were reported by 29 cities. These compared to February last year show an increase of 62 per cent. in the number of permits issued for the construction of single-family dwellings. Apartment house construction continues at about the same rate as last year. For the non-residential building groups—factories, private garages, and public buildings are well ahead of last year, while amusement and recreational places are distinctly fewer. Permits for additions or alterations to residential buildings are more than double the total of February, 1926, and it seems that work of this character will be an important portion of building operations in 1927.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Car Skidded

And then someone discovered that his broken window or smashed fence was his dearest possession and put in a bill of damages to prove it.

And the automobile owner paid—because his insurance didn't cover damage to the property of others.

Your agent can get you automobile policies covering property damage, collision, public liability, fire and theft. How well are you insured?

**"ANTI-HYDRO" Made the Leaky Walls and
Pits in this Post office
Waterproof!**

The concrete pits and the walls of the pipe tunnels in this post office leaked badly. A cement plaster coat mixed with "ANTI-HYDRO" was applied to the *inside* of the walls and pits. Now they are absolutely and permanently waterproof. There is not a single concrete waterproofing or hardening problem that cannot be successfully overcome by the use of "ANTI-HYDRO." It is an easy-to-use liquid integral compound that mixes readily with the gauging water without the aid of skilled labor. Results are guaranteed permanent. Use "ANTI-HYDRO" on your next job. For over 23 years it has been specified by leading architects, engineers and contractors.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

LAND - ARMSTRONG & LATTA CO., PHILADELPHIA - WATER

PHILADELPHIA

Yesterday and Today

PHILADELPHIA can justly be proud of its progress. Nearly every day changes take place that beautify this old historic city.

The northeast corner of Ninth & Chestnut Streets is now graced by one of the most beautiful and imposing department stores in the world. Surely it is a great credit to the

builders' art, and to the owners themselves.

Philadelphia today is one of the most beautiful cities in the world. Philadelphia tomorrow will be the ideal city of comfort, convenience, and beauty combined.

Co-operation is the watch-word of modern progress.

THE VAN SCIVER CORPORATION

USEFUL HINTS ON SIDEWALK CONSTRUCTION

As Spring approaches and plans for suburban building get under way, the matter of sidewalks will require attention. In many localities only concrete walks are permitted. In any case, sidewalks are a part of suburban development and concrete is the most popular type as is evidenced by a visit to almost any of the city's suburbs.

In the laying of sidewalks, every precaution should be taken to see that the concrete is uniform. There should be a uniform distribution of the aggregate throughout the mass and the better way to be sure of obtaining that is in the use of hydrated lime. When lime is added to the mixture the concrete becomes smooth and plastic, is easily handled by workmen and assures a pavement that is smooth, white and durable.

About ten pounds of lime should be added to every sack of cement to assure

a mixture that will give the best results. If that course is followed the concrete walk will offer maximum resistance to cracking and to chipping and will be found to retain its stability throughout the year, avoiding warping and dishing to form puddles after a rain.

The addition of lime to the concrete, on the basis stated above, will add virtually no cost to the paving. If a little greater outlay is necessary in the first instance to add lime, its cost will be more than offset in reduced labor costs and in durability. Concrete containing lime is far more workable than concrete without lime and the men laying the payment will make faster time and accordingly reduce placing costs.—*From National Lime Association, Washington, D. C.*

Construction costs increased during February, reaching a point slightly above the level which they held one year before, according to statistics compiled by the Associated General Contractors of America.

The increase in total costs was the result of wage increases and of higher prices commanded in several localities by certain building materials, notably crushed stone and gravel.

The average of wages paid in the construction industry rose during February to the highest point reached since 1920, with the exception of the level occupied in May, 1926.

You owe it to yourself to keep in touch with what is going on in the trade, and you can do this only by becoming a subscriber to and regular reader of your trade paper. If you are not a regular reader of the Builder's Guide you should be. The cost is not excessive. A ten spot insures it fifty-two times in the course of a year.

It is surely an injustice to your workmen as well as a source of loss to yourself to supply poor tools in your shop equipment. No man can do anything approaching good work with tools that take the edge off enthusiasm. In shop management, as in most things, details are the whole cloth. Tools are like men. They do good work or they do not, according to the character which they possess. Character in tools is a matter of good materials, expert making and correct design.

Man and the giraffe are the only two living things that can't swim naturally. Throw a day-old kitten into the Mississippi and it will paddle its way to shore. The giraffe can't swim because he's not built that way. Man can't swim, just because he is afraid. The chances are that the reason you are not in the swim—financially or otherwise—is because you are afraid.—Glen Buck.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

"ANTI-HYDRO" Protects this Stucco House Against Wear and Weather

C. J. WALKER
RESIDENCE—
IRVINGTON—
ON THE
HUDSON, N. Y.

V. W. TANDY,
ARCH.

MILLER,
REED & CO.,
BUILDERS

"ANTI-HYDRO" both hardens and waterproofs stucco in one operation. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color, or it may be used with pure white cement, without dimming or changing the color. "ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 23 years it has proved its superiority. Use "ANTI-HYDRO" on your next job for permanently hard and waterproof stucco work.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.

Residence, 208 West Twenty-eighth street, Wilmington, Del., \$7,800. Architect, private plans. Owner, Mrs. E. M. Hill, 210 West Twenty-seventh street, Wilmington, Del. Brick, 2 stories, 24x34 feet, Carey roof, hot water heat, electric work. Contract awarded to Charles Eckman, 821 Orange street, Wilmington, Del.

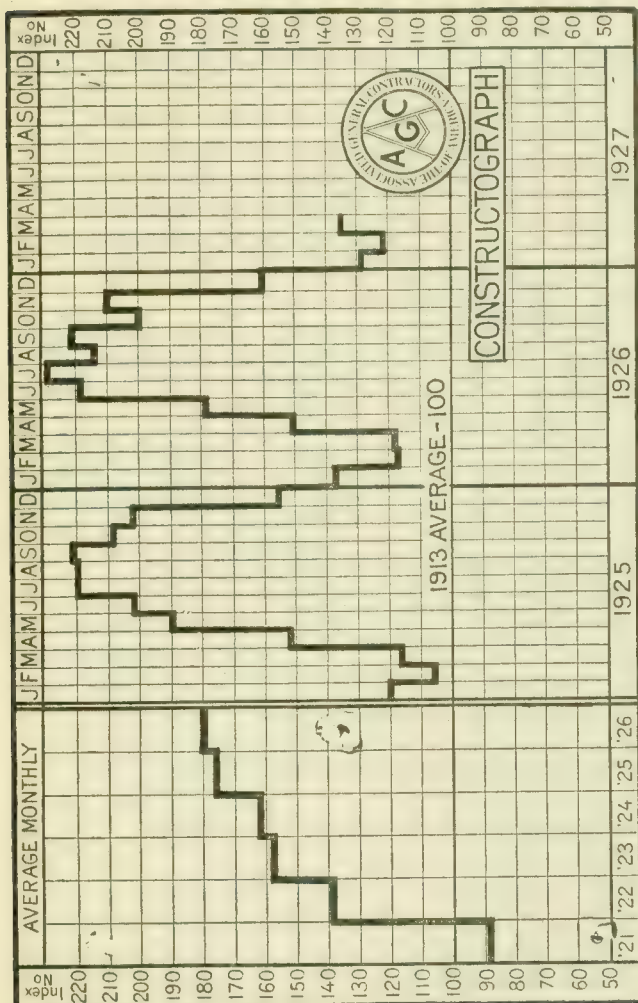

A new record has been added to the long list established by construction operations during recent months. Brisk activities in March brought the volume of construction during the first three months of 1927 up to a mark higher than has been registered during that period of any other year, according to statistics compiled by the Associated General Contractors of America.

The volume of work performed last month was 12 per cent. greater than the February figure, and 13 per cent. greater than the total recorded for March, 1926.

Meanwhile, the awards of contracts for future work have assumed a sturdy volume. The total for January and February of this year is equal to the combined figures for the first two months of the record-breaking year of 1926. The volume of contracts awarded during February shows an increase of 2 per cent. over January and a rise of 16 per cent. above the mark set in February, 1926.

The indications are that when the figures on volume of construction work carried on during this month are compiled, 1927 will be shown to have extended its leadership over previous years. An increase in April of 6 per cent. over the March volume will give the present year the distinction of having seen more construction work under way during the first four months of the year than has ever

been recorded in the past. The natural tendency toward an increase in the volume of operations during this season of the year is shown by the 25 per cent. rise which April registered over March last year.

THE year 1926 established a new high record for building construction, the total expenditure for new buildings and alterations being in the neighborhood of \$7,000,000,000. Some apprehension is felt in certain quarters, that this pace cannot be kept up. As a matter of fact, we believe that the peak has probably been reached and there is no doubt that certain types of buildings are at present a glut on the market. We refer to the large, pretentious apartments and office buildings, put up at great expense where the rentals are so prohibitive that few can afford to occupy either the apartment or the offices. However, considering the scarcity of labor, somewhat of a letdown in the construction industry would not be a calamity and the outlook for 1927 is already very encouraging.

Messrs. S. W. Straus & Co., a well-known investment banking institution, have declared, according to *Building Age* and *National Builder* that New York City and many of our larger cities have been overbuilt with high-priced apartment houses, apartment hotels and hotels, as well as high office buildings. Mr. Straus said a truce should be taken on building for six months or a year, in order to permit the buildings already built to be occupied.

His remarks have been wrongly construed in many parts of the United States.

It is true that 80 per cent. of the building done in the United States is east of the Mississippi River, and a very large amount of this building is done in the states of Pennsylvania and New York. A 20 per cent. reduction in building operations in New York and Pennsylvania is going to show itself as quite a sizeable reduction in the total volume of business. The rest of the country must show a great increase in order to overcome any drop in building activities shown in the two states mentioned.

"It is true that the classes of buildings, mentioned by Mr. Straus have been going up at a very rapid rate in New York City. It is a fact that many people in New York City are compelled to spend nearly one-half of their income for rent, and this is not due always to any desire to live near the White Lights. A great many people are compelled to live in Manhattan or in communities close to Manhattan, in order to be near their place of business. Rents have gone up rapidly and there has been a great desire on the part of many speculative builders, to put up palace-like apartment houses and apartment hotels. It will be many, many years before the real need for medium priced and low priced apartments is going to be met.

In the mean time over the whole United States there is evidence of an increased activity in the building of single and double family houses and in the construction of small apartment houses. At the present moment, the need for modern homes in America is far from being filled and the outlook for a good year of building is excellent. No truce need be considered in general building work even though one authority counsels caution in continuing the erection of certain types of New York buildings.

Such doubts as have been in the minds of producers, contractors, dealers and other interests in the construction industry at New York as to what the spring season would show, in the opinion of *The Clay Worker*, are now passing—and passing definitely. There is no longer any question, despite the fact that the season is only about to turn. Since the beginning of March, there has been a spurt in activities, covering both actual commitments and advance work, enhanced by favorable weather conditions, and some bright weeks loom ahead in the field.

The stage seems set in the New York zone for a heavy volume of construction throughout the spring and summer months, and the next 30 to 60 days will show actual contract awards of more than \$250,000,000 if the prophecies of architects and engineers come to pass. This figure is a conservative one, even though it does seem large at first reading, for New York is a big city and does things in a big way. For the first two months of the year, winter periods, contracts

placed total about \$150,000,000 covering about 1,100 different operations in all five boroughs. During the same time a year ago, the number of projects was less, aggregating 1,050, but the total estimated cost stood at \$200,000,000.

The first week in March exhibits an upward trend, with contract commitments reaching to \$26,800,000; the end of the month is expected to show a round total of well over \$115,000,000. These figures are rather remarkable considering that speculative interests are gradually leaving the field for the time being, the "over built" idea having more substance than mere guesswork; there is unquestionably a slackening in the demand for large commercial buildings, apartment houses and apartment hotels—and these are the structures that the speculator exists upon.

Demand for Smaller Buildings

Thus, the demand of today is for the smaller operation, such as medium sized apartment houses, office buildings, and dwellings; tenements of model type, also, are high in the point of call, and the east side district in Manhattan Borough is scheduled for some notable developments in this line during the coming season. Industrial operations are exhibiting the unexpected tendency of increasing, particularly in the Long Island City territory, which has made exceptional expansion in this direction during the past few years. Public buildings are another factor in the present situation, and plans are on the boards of architects for considerable work of this character in the early weeks ahead. As to be expected, residential operations continue in the lead over all other types of buildings, the present weekly average running from 140 to 190 operations of this kind.

Statement of the Ownership, Management, Circulation, etc.

Statement of the ownership, management, circulation, etc., of *The Builders' Guide*, published weekly at Philadelphia, Pa., required by the Act of August 24, 1912, for April 1, 1927.

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

"ANTI-HYDRO" Protects this Stucco House Against Wear and Weather

C. J. WALKER
RESIDENCE—
IRVINGTON—
ON THE
HUDSON, N. Y.

V. W. TANDY,
ARCH.

MILLER,
REED & CO.,
BUILDERS

"ANTI-HYDRO" both hardens and waterproofs stucco in one operation. It prevents stucco from chipping, crazing, map-racking and discoloration, and insures a dry interior at all times. The admixture of "ANTI-HYDRO" makes portland cement bond securely to tile, brick or concrete. Any tone may be obtained through the addition of a dry mortar color, or it may be used with pure white cement, without dimming or changing the color. "ANTI-HYDRO" is a liquid integral compound. It mixes readily with the gauging water—any unskilled workman can do it. For 23 years it has proved its superiority. Use "ANTI-HYDRO" on your next job for permanently hard and waterproof stucco work.

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

Compo-Board

REG. TRADE MARK

Successfully used for walls and ceilings for over thirty years.
Insulates. Takes any decoration. Will not warp.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

You can't expect to do your "bit" of this busy world's business unless you enlist in the advertising ranks.

STATEMENT BY COMMITTEE APPOINTED TO SURVEY THE GENERAL CONDITION OF THE FIRST MORTGAGE REAL ESTATE BOND BUSINESS

At a meeting called last November in New York City by the American Construction Council, and attended by a large number of bankers, contractors, architects, accountants and representatives of investment banking and first mortgage real estate bond houses, the American Construction Council was asked by resolution to appoint a committee of seven representatives of the first mortgage real estate bond houses, of which committee Mr. Franklin D. Roosevelt, President of the Council, was to be chairman "to survey the general condition of the real estate bond business and to co-operate in such survey with the committee of the Securities Commissioners of the several states, with power to add to its membership and to appoint sub-committees and to report at a subsequent meeting of this body at the call of the chair."

Pursuant to the foregoing resolution Mr. Roosevelt appointed the following committee:

Edgar N. Greenebaum, Greenebaum Sons Investment Co., Chicago, Ill.

Wm. J. Moore, American Bond & Mortgage Co., New York City.

Alfred J. Murphy, Federal Bond & Mortgage Co., Detroit, Mich.

G. Bryan Pitts, The F. H. Smith Co., Washington, D. C.

Edward Sonnenschein, Chicago Mortgage Bankers' Association, Chicago, Ill.

S. W. Strauss, S. W. Strauss & Co., New York City.

J. M. Ulmer, Mortgage Bankers' Association of Ohio, Cleveland, Ohio.

This committee has since then been in almost continuous session, and a full and frank discussion of the methods of this very large and important part of the financial and building structure of the country has been had. The committee has examined, so far as possible, into every phase of the transactions of purchase, construction, interest and amortization. The committee has also had the advantage of frequent consultation with Mr. A. J. Maxwell, President of the National Association of Securities Commissioners, popularly known as the "Blue Sky Commissioners," and with the Committee on Real Estate Mortgage Bonds of that Association, consisting of Messrs. David H. Jennings, Indianapolis, Ind., Hezekiah N. Duff, Lansing, Mich., Keys Winter, Deputy Attorney General of New York State, and R. E. McNellis, Nashville, Tenn., and with the counsel for that committee, Maurice L. Mendenhall, Indianapolis, Ind.

The committee is not yet ready to make a final report, but does believe that the public should now be informed that on January 21st, at a meeting in Chicago, representatives of six large bond houses entered into an agreement adopting certain principles or canons of procedure. This agreement was signed by Greenebaum Sons Investment Co., of Chicago, American Bond & Mortgage Co., of Chicago, The F. H. Smith Co., of Washington, D. C., Federal Bond & Mortgage Co., of Detroit, and S. Ulmer & Sons, Inc., of Cleveland. It was stated in writing by S. W. Strauss & Co., that it would comply with the requirements of the agreement, declaring further its adherence to its own practice, providing that it be simply in addition to and not in diminution of said requirements. All of the committee of the National Association of Securities Commissioners, referred to above, except Mr. Keyes Winter, Deputy Attorney General of New York State, gave their approval in writing to the draft of principles or canons of conduct; Mr. Keyes Winter stated that those portions of the agreement over which he had jurisdiction were satisfactory to him in so far as they conform to the principles of absolute separation of trust accounts from the risks of the business and of notice to bondholders of defaults.

The agreement is as follows:

We, the undersigned, first mortgage real estate bond houses, recognize as essential for the proper conduct of the business in which we are engaged, certain principles which will insure the financial stability and correct economic conduct of houses of original issue selling such issues principally at retail directly to the investor, and do hereby adopt and subscribe to the following business principles as accomplishing that end:

Duties of Houses of Issue

All first mortgage real estate bonds that shall be sold by the house shall be safe and conservative investments.

It shall be the duty of each house:

(a) To provide and maintain funds necessary for, and to make, all payments in connection with the construction project in accordance with the terms of the underwriting agreement.

(b) To check and supervise construction in order to procure substantial compliance with the plans and specifications.

(c) To guarantee to the bondholders completion of the building free and clear of prior liens, such guarantee to be fulfilled at the option of the house of issue, either by completion of the building or by the repurchase of the bonds at the original purchase price and accrued interest.

It shall be the continuing duty of each house:

(d) To check and enforce the proper physical maintenance of the security after completion.

(e) To check and enforce maintenance of insurance.

(f) To check and enforce payment of all taxes and assessments when due.

(g) To check and enforce compliance by the borrower with requirements of all laws and ordinances and other governmental regulations.

(h) To provide for the collection of principal interest and income tax payments from the borrower, and to provide adequate facilities for payment of same to the holders of securities as and when the same are due.

Trustee

For the purpose of carrying out the foregoing and other duties, the house of issue shall either act as trustee or provide a trustee to take title under the indenture. Where the trustee is not a bank or trust company under public supervision, the trustee shall be an officer or director of the house of issue and where the trustee is not an independent bank or trust company under public supervision the house of issue shall be fully responsible for all acts of omission or commission by the trustee to the same extent as if the house of issue were itself the trustee. The assumption of such responsibility by the house of issue shall be authorized by proper resolution adopted by the house of issue set forth in its minutes, and by such other formal instruments of assumption as may be requisite. The appointment of an officer or director of the house of issue shall not preclude the appointment of an additional trustee, but the appointment of such an additional trustee shall not in any event relieve the house of issue of its responsibility. In any event where the house of issue or any of its officers or principal stockholders has any interest in the equity, the trustee and—or the additional trustee shall be an independent trustee.

Advances of Money by House of Issue

The Trust Deed shall provide that when the house of issue advances funds for principal and—or interest, it shall be the duty of the house of issue, to pursue one of the following causes within ninety days after the maturity of such principal and—or interest payments:

(a) To subordinate such bonds and—or coupons to all unmatured bonds or coupons of the same issue; such subordination to be by physical endorsement on the bonds and by appropriate action with respect to the coupons.

(b) To notify the trustee and all holders of bonds of the same issue that funds were advanced by the house of issue and that it intends to hold all such bonds and—or coupons, on a parity with the balance of the issue.

If the notice provided for in paragraph

(b) shall not have been given, the subordination shall be automatic. Advances made by the house of issue for any payments due by the borrower shall hereafter be made only from the capital and surplus account of the house of issue.

Irrespective of subordination where the borrower fails for a period of eighteen consecutive months to pay at least one-third of the aggregate of principal and interest payments maturing during such period, the house of issue shall notify all holders of the bonds of the same issue of the default.

Appraisals

In order to assure conservative and sound appraisals and to facilitate their analysis, the house of issue shall provide and be prepared to furnish as required, an appraisal setting forth in detail all items upon which it is predicated, and the specific amounts or percentages allocated to each item, together with the names and qualifications of the appraisers. The publishing or furnishing of appraisals shall mean that in the judgment of the house of issue, based upon its own investigation, such appraisals are reasonable and sound. Irrespective of the value of the security as determined by appraisals, the borrower in every issue should be required to have a substantial investment in the project. Efforts shall be immediately initiated to secure a uniform basis of appraisals.

Circulars

Circulars should contain adequate information on the following points:

1. Location and description of security.
2. Ownership of property.
3. Name and identity of trustee.
4. Valuation of land or leasehold.
Valuation of buildings.
Name of appraisers.
5. Earnings (gross and net), whether actual or estimated.
6. Purpose of issue.
7. Amount of issue.
Interest rate.
Principal payments.
8. Provisions for and place of collection and distribution of principal, interest and income tax payments.
9. Guarantee of house of issue to bondholders, of completion of building, free and clear of prior liens, with right to discharge such liability at the option of the house of issue by the repurchase of the bonds at the original purchase price and accrued interest.
10. Full disclosure of any interest, direct or indirect, of house of issue or its officers or principal stockholders in the security other than as the house of issue.

Interim Receipts

Sales of securities before the permanent bonds are available, should be either through the sale of temporary bonds ex-

ecuted by the mortgagor, or interim receipts in which the trustee shall join as a party, and which shall certify that there has been delivered to the trustee a temporary bond which is held by the trustee for the benefit of the holders of interim receipts to the extent of their respective holdings.

Accounts

Each house of issue shall maintain a construction liability account, an interest and amortization account, and a capital account.

The construction liability account shall consist of all of the liabilities of the house of issue to borrowers on construction issues. The house of issue shall at all times have assets consisting of cash, governmental securities, assets convertible into cash within forty-eight hours, or bonds secured by uncompleted or completed buildings, or loans fully collateralized by such bonds, at least to the amount of the total liabilities in said construction liability account; provided, however, that none of the aggregate of said bonds shall be composed of bonds maturing in more than one year, which have been repurchased by the house of issue at the request of the holders thereof.

The interest and amortization account shall hereafter be carried as a separate trust account and shall consist of all of the liabilities for principal, interest and tax payments paid by borrowers to the house of issue before payment thereof to the holders of bonds. The house of issue shall at all times have assets consisting of cash, governmental securities, or other assets convertible into cash within forty-eight hours, at least to the amount of the total liabilities in said interest and amortization account.

Withdrawals of cash from either the construction liability account or the interest and amortization account shall be only to make payments for liabilities included in said accounts, or for the purchase of assets of the kind and character provided for in said respective accounts.

Solvency and Liquidity

The solvency and liquidity of the house of issue enabling it to promptly meet all obligations at maturity, shall be maintained at all times.

1. By the house of issue having on hand at all times assets consisting of cash, governmental securities, or other assets convertible into cash within forty-eight hours, in an amount in excess of all liabilities which will reasonably mature within thirty days, with the right to credit against the amount of such liabilities, an amount equal to one-half of the cash sales of the house of issue for the preceding thirty day period; but in no event shall the credit for such cash sales exceed two-thirds of the amount of the liabilities maturing within the following thirty days.

2. By having on hand assets in addition to those required under the provisions of section 1, which can reasonably under ordinary business conditions, be converted into cash within sixty days to an amount equal to at least 33 1-3 per cent. of all liabilities beyond those maturing in the ensuing thirty days, and other than capital and fully collateralized liabilities.

3. To maintain assets not in default and not frozen at least to the amount of all liabilities other than those named in provisions No. 1 and No. 2 and other than capital and fully collateralized liabilities.

Correct statements of financial condition, properly verified by independent, certified or public accountants, shall be regularly forwarded to the authorities of the various states having jurisdiction or supervision of the houses of issue or of the securities issued by them. The accuracy of the statements submitted as well as the general condition of the houses of issue should at all times be subject to inspection by the properly constituted authorities of the various states.

Effective Date

The above provisions shall become effective as to each house of issue subscribing hereto not later than ninety days after such signature, and shall refer only to issues made or purchased by the houses of issue thereafter and shall not be retroactive as to any issues made prior thereto, provided that the accounts above mentioned shall be set up as much prior to said ninety days as practicable.

* * *

We reiterate our belief and conviction that adherence to the foregoing business principles will insure the stability and integrity of our business, and enable us to function as a distinct and independent unit in the investment field, rendering effective and valuable aid in the development of the economic structure of the country.

Subscribed to by the following houses of issue at the dates set opposite their names:

Greenebaum Sons Investment Co., by Edgar N. Greenebaum, Vice Pres. Dated January 21, 1927.

American Bond & Mortgage Co., by William J. Moore, President. Dated January 21, 1927.

The F. H. Smith Company, by G. Bryan Pitts, Chairman of Board. Dated January 21, 1927.

Federal Bond and Mortgage Company, by Alfred J. Murphy, President. Dated January 21, 1927.

S. Ulmer & Sons, Inc., by J. M. Ulmer, Treasurer. Dated January 21, 1927.

The foregoing draft of principles and provisions for the conduct of the first mortgage real estate and bond business is hereby approved by the Committee of the

National Association of Securities. January 21, 1927.

David H. Jennings, Chairman; Hezekiah N. Duff, R. E. McNellis.

The Committee unanimously feels that this agreement is a long step in the right direction in an industry which during the year 1926 sold approximately a billion dollars of first mortgage real estate bonds to the public and which has been responsible for the construction of many needed buildings and for replacing obsolete structures.

Mr. Roosevelt, Chairman of the Committee, personally believes that before the Committee makes its final report further steps should be taken, but is of the opinion that the results obtained from the present agreement made by certain bond houses with the Committee of the National Association of Securities Commissioners will furnish a better basis of determining what those steps should be and how far they should go.

In view of the Chicago agreement, the Committee has adjourned to await the result of the present steps and to confer later to consider those results and other matters not yet disposed of by the Committee. In the meantime a sub-committee has been appointed to consider uniformity in appraisals.

The problem of making concrete watertight, detailing experiences of architects, engineers and contractors in various sections of the country, with data on the strength and permeability of concrete, is discussed in a recent bulletin of the National Lime Association under the title of "Watertight Concrete."

There is no mystery about making concrete watertight. First, the concrete must be made uniform and workable so that it reaches every corner of the forms and flows around the steel without pockets or bridges. Second, the voids must be filled. Hydrated lime does both. The microscope shows approximately 85 per cent. would pass through a screen having 860 meshes per linear inch, or 739,000 openings per square inch if such a screen could be made. These particles work into the voids and fill them so that water cannot penetrate. Even when the voids are filled, the water-tightening action of lime does not stop.

While void filling is well enough as far as it goes, there must be no porous areas like stone pockets, bridges or honeycombs. The action of lime prevents them, for lime makes concrete so workable that every corner of the forms is sure to be filled. All steel, even in the most intricate reinforcing, is completely and uniformly bedded in dense and homogeneous concrete. Segregation is eliminated and the steel is firmly gripped in rust-preventing concrete.

All concrete should be watertight. Concrete basements and floors must be kept dry; concrete sewers and mains should be kept tight; retaining walls, dams, reservoirs and swimming pools must be watertight; factory and office buildings will be more permanent if protected against water, it is asserted in the bulletin.

Water is one of the worst enemies of good concrete construction. Too much mixing water means weak, porous concrete and too great a variation in the moisture content after it has hardened causes cracks. "Just concrete" is no longer good enough. Engineers know that stresses due to moisture variations are greater than those due to temperature. Hydrated lime keeps the moisture content uniform, avoiding internal stresses and cracking. This is particularly evident in concrete road construction, where roads containing lime have only 50 to 70 clean cut transverse cracks per mile, while roads without lime may have from 200 to 300 ragged cracks in the same distance.

Where reinforcing steel is alternately damp and dry, as is the case with porous concrete, rust soon spalls off the concrete which covers the rods. Hydrated lime prevents this action in two ways, first by making a dense and uniform covering of the steel without danger of pockets or bridges, and second because its alkalinity prevents rust.

The use of hydrated lime by the leading architects, engineers, and contractors throughout the country, testifies to its reliability and continuing effectiveness. It is used by army engineers in river and harbor improvements, and the intricate and massive concrete in the Wilson Dam at Muscle Shoals all contains lime. Its cost is offset by the increase in workability and the decrease in handling expense.

The best way to make concrete watertight, according to the bulletin, is to add hydrated lime to the mix. The results are permanent and satisfactory. Permanence and void filling, high workability and uniformity, freedom from segregation and cracking, high strength and pleasing color are essential. Hydrated lime gives these qualities to concrete, and is carried in every building material dealer's stock.

Concrete containing lime is placed with less water than concrete without lime. The natural smoothness of the lime is imparted to the concrete and it flows down the chutes in a uniform and stiff but plastic mass, without clogging and without segregation. There is no need for the man at the mixer to flood the concrete in order to wash it down the chute and into the forms. The quakey mass handles easily, spades well, and when the forms are removed is smooth enough for any purpose.

Twenty-three Years Without a Change

This "ANTI-HYDRO" formula for permanently hardening, waterproofing and damp-proofing concrete, stucco and cement mortar has stood unchanged for 23 years. During all this time it has been successfully used on every type of concrete hardening, waterproofing, acid, alkali, and oil-resisting work and has never failed to produce extremely satisfactory results.

Being a liquid integral compound, "ANTI-HYDRO" mixes readily with the gauging water without the aid of skilled labor. It is easy and economical to use. It so enriches the concrete that one troweling is usually sufficient for a perfect finish. It also strengthens the concrete and accelerates the hardening of cement, thus eliminating costly overtime work.

"ANTI-HYDRO" is the oldest compound of its kind in existence. Use it on your next job for real, lasting satisfaction.

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

Compo-Board

REG. TRADE MARK

Successfully used for walls and ceilings for over thirty years.
Insulates. Takes any decoration. Will not warp.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Do you want to build a business for yourself? Something that will grow bigger in the years to come.

A N. Y. Corporation, having exclusive control of an exceptional product used in Industrial Buildings, Factories, Shops, Schools, Etc., desires to secure services of a high-class salesman to handle Eastern Penna.—Phila. included—Delaware, and Southern New Jersey, the richest manufacturing territory in America. The product is well introduced, being used in the U. S. Mint, the B. & O. Ry., and by other nationally known concerns. A rare opportunity is offered to a man of ability who is willing to work hard, with intelligence and unfaltering courage. No loafers wanted. Only an ambitious man who never knows when he is licked. Such a man can establish a life-time business and achieve independence in a few years. Have you got the "Never Say Die" qualities to tackle a job like this? If so, address, W. M. R., Room 811, Astor Trust Bldg., 501 5th Ave. N. Y. City.

Just remember this: Give out courtesy, kindness, patience and good-will, and you'll get them all back with compound interest. The men who deserve to rank in Class A do not chew the lint and fuss about the small misfits of life. To take what comes and forget the rest is wisdom. Let Braggo give the janitor the call, and the Hall Boys have it out with the Ashbox Inspector—you can't afford to soil your soil with small scraps. Fight on a big scale, or not at all. The folks who have trouble with ushers are always looking for trouble—and find it. Smile, old boy, smile!

"Facts are stubborn things." Advertise only the truth about your product and watch the result.

Many a man would do a better job if he didn't know about putty.—Ex.

PROGRESS OF BUILDING INDUSTRY DEMANDS ELIMINATION OF WASTE

An Address by CHARLES F. ABBOTT, *Executive Director, American Institute of Steel Construction, Inc., 225 Madison Ave., New York City*

The United States is prosperous today, but it is prosperous despite an appalling burden of economic waste which only a young and vigorous nation could carry without staggering beneath the load. Even this country cannot, without grave danger to the well-being of the nation and its people, permit the existence of such a drag upon progress for an indefinite period.

Industrial wastes alone are causing an annual loss of \$30,000,000,000 in raw

material and man power. Of the \$60,000,000,000 earned each year by the 44,000,000 persons gainfully employed within our borders, \$10,000,000,000 is wasted. One billion of this goes into the pockets of the promoters of get-rich-quick schemes which enrich only their unscrupulous organizers.

The construction industry, and its allied trades and professions, must plead guilty to being responsible for, or tacitly abetting, the squandering of a considerable proportion of our resources. Between three and four per cent. of building costs represents largely unnecessary estimating expense. In other words, between \$180,000,000 and \$240,000,000 is expended every year by contractors and sub-contractors in bidding and estimating before construction is begun.

The varying restrictions contained in many municipal building codes make it impossible to use materials to the best advantage, and result in unnecessarily high costs which must ultimately be borne by the public. Obsolescence, construction delays, the ill-advised selection of materials—all these are a drain on the prosperity of our people and a check upon the development of the building industry.

The American Institute of Steel Construction was organized in 1921, by the structural steel fabricators of the United States and Canada, to dam this drain and remove this check. One of the primary objects of its organization was the elimination of waste in all that concerns the use of structural steel. In preparing the program of activities, the Directors of the Institute followed the suggestion of Herbert Hoover, Secretary of Commerce, to whom belongs the credit for the initiation of a wide-spread move towards the abolition of waste in industry.

The following is a summary of the fundamental policies of the Institute—

TO FURTHER better methods and the elimination of waste by standardization and simplification through the medium of a constructive co-operative program to the end—

THAT greater efficiency may be applied to production and selling, and that the mills, architects, engineers, contractors, the public, and members of the structural steel industry, may derive equal benefits;

THAT the adoption of the Institute's Standard Specification, prepared to promote standard uniform practice, may give to the public the economies that would follow, thereby contributing a material reduction in building costs;

THAT both buyer and seller may profit through a Code of Standard Practice, and recognition of established ideals and better ethics as applied to all trade relations;

THAT new uses and broader markets may be developed by the promotion of instructive, educational campaigns, and by the distribution of helpful information;

THAT assistance may be extended to students in the technical schools in order that their knowledge of structural steel may be advanced and the public profit through the stimulation of greater interest on the part of those who are to enter the architectural and engineering professions;

THAT each individual engaged in the fabrication of structural steel may receive the benefits from organized effort after the interest of the public has been served, thereby assuring the future security and prosperity of the industry.

With an original membership of fifty fabricating plants, the Institute now represents 218 plants engaged in the fabrication and erection of structural steel in the United States and Canada. This membership produces over ninety-nine per cent. of the total output of structural steel in the two countries, excluding the production of the plants controlled by the rolling mills. The industry transacts a business of approximately \$300,000,000 a year.

The activities of the Institute are financed by an assessment paid by each member upon the basis of his tonnage output, and by contributions received from the Bethlehem Steel Company, the Jones & Laughlin Steel Corporation, the Inland Steel Company and the Scullin Steel Company.

The United States Steel Corporation and its many subsidiaries, including the American Bridge Company, are co-operating with the Institute in the furtherance of its educational work. As yet, however, no financial assistance has been extended.

In a recent address delivered by Mr. O. H. Cheney, Vice-President, American Exchange-Irving Trust Company, before the Boston Chamber of Commerce, the following statement was made—

"The United States Steel Corporation, the greatest corporation in the country, and the one most affected by concrete competition, owns the Universal Portland Cement Company which contributes, I understand, a considerable part of the Portland Cement Association's fund. So the Steel Corporation with the right hand is selling steel to the structural steel fabricators and with the left hand is helping to take away their business."

If this statement is correct it seems reasonable to believe that the Steel Corporation will soon see the wisdom of doing as much for steel as it is now doing to aid its chief competitors.

The overwhelming majority of architects, engineers, and contractors throughout the country have shown themselves to be in hearty accord with the Institute's aims, and the methods which have been chosen to achieve them. Such an accord is natural. The Institute's activities assure their prosperity to almost as great an extent as they promote the interests of the producing mill and the fabricating plant.

Prosperous conditions for all elements of the construction industry depend upon building activity. This, in turn, depends upon reasonable costs and the application of all approved aids to good construction. There has been talk of a saturation point in building, but that point will never be reached if we take advantage of all possible economies, and if our builders continue to erect better structures each year.

To realize our great possibilities, however, the principle of co-operation must be recognized and applied by all. Co-operation between engineer, contractor, architect, the fabricator of structural steel, and the rolling mill, must supplant individual and selfish objectives. Statistics relative to the prosperity of innumerable industries show that their success is largely built upon co-operation to promote standardization and uniform practices in the utilization of the product.

It has been estimated that the automotive industry saved \$750,000,000 in one year through the adoption of dimension standards formulated by the Society of Automotive Engineers. In 1902 automobiles sold for an average of one dollar a pound. In 1926 the average sales price was twenty-nine cents a pound, yet the cars were vastly superior in quality and were equipped with many features never thought of twenty-four years ago. Standardization has proved to be the automobile manufacturer's key to prosperity.

The surest way to make certain that a like key will never be found for the industry upon which we are all dependent for a livelihood is to remain blind to the necessity of that co-operative activity which alone makes standardization effective. Whether it be the rolling mill, the fabricating plant, the designer, or the builder—all who fail to put a shoulder to the wheel are retarding the prosperity of their industry and of themselves as individuals or concerns.

The American Institute of Steel Construction is still young. Many of its activities have only just been undertaken. Others are only projected at the present time. Already, though, the Institute has succeeded in eliminating many wasteful methods, and in promoting better construction by standardization and the encouragement of the most effective use of steel.

It should be clearly understood that

from the beginning the Institute has been opposed to any policy that would transfer the functions of the architect or engineer to the fabricating plant. The fabricator is a manufacturer who turns the shapes produced by the rolling mills into structural material. He is not a designer, and should not be expected to function as such. The Institute has consistently held that the engineer or architect should furnish all designs and should be properly compensated for his labors.

Designs should be complete, with full information concerning plans, in order that the most accurate estimate of steel costs may be submitted and the ideas of the designer efficiently executed. Furnishing full information at the time when the contract is awarded will further speed erection and completion of the building.

Co-ordination of effort between architect, engineer, contractor and the fabricator of the steel, will replace guess-work with accuracy, avoid duplication of effort, controversies and unnecessary delays—all of which will tend towards the abolition of avoidable expense that otherwise would have to be included in the sales price.

As far as the architect and engineer are directly concerned, the Institute's aim has been two-fold. It has sought to apply an approved basis for design. It has sought to formulate a standard specification that would free competent men from the alternative of adopting irresponsible practices or seeing a contract go to a competitor who might adopt them, and thus be able to obtain a contract by quoting a lower cost.

At the time of the Institute's organization there was no generally accepted standard governing the fabrication, the design, or the erection of structural steel. Individual architects and engineers had their own standards, scarcely any two of which were alike. Varying trade customs were the cause of continuous misunderstandings between buyer and seller. Municipal building codes differed greatly throughout the country.

It was felt that the immediate necessity was for the formulation of standard practices to take the place of the diverse and largely rule-of-thumb methods prevalent at the time. As the first step in this direction, a committee selected from the leaders in the engineering, architectural and academic professions, was called upon to prepare a standard specification covering the manufacture and use of structural steel. Safety combined with economy was the goal in view.

Although completed but three years ago, more than 100 large cities in the United States and Canada have either adopted, or are permitting the use of, our Standard Specification. A report of a joint committee representing the Amer-

ican Society of Civil Engineers and the American Institute of Steel Construction has unanimously recommended the endorsement of an 18,000 pound unit stress as embodied within the Institute's Specification.

Activities initiated by the Institute have done much to eradicate the once numerous sources of misunderstanding between buyer and seller of structural steel. Information concerning the difficulties that had developed in the past was solicited from architects, engineers, contractors and other interests. Every effort was made to bring to light all the vague and inconsistent trade practices that had too frequently resulted in recourse to the courts.

The Institute's Code of Standard Practice has been described as the most accurate and comprehensive code ever devised for any industry. Fair to both buyer and seller, its use is doing away with causes of dispute which might otherwise have led to costly litigation, and is paving the way to an amicable adjustment of such unavoidable misunderstandings as may occur from time to time.

Economies made possible by the Institute's program are of direct benefit to the public as well as to the construction industry. Lower costs for the fabrication of steel, or for erection, are reflected in lower rents. In the case of structures erected by the municipal, state, or federal government, lower costs are reflected by lower taxes. The saving made possible by the Institute's Standard Specification alone, when generally adopted, will result in a tangible economy of approximately \$50,000,000 a year.

In addition there will be many intangible savings, the extent of which it is difficult to estimate with any degree of accuracy. It is impossible to say how much will be saved as all fabricating plants proceed in a uniform manner, without the necessity of juggling their practices to meet the innumerable variations required in the past. It is difficult to put a monetary value on the time wasted by engineers and architects in adapting their plans to widely varying building codes.

The concern that fabricated and erected the steel for the Medical Arts Building in Denver last year estimated that the steel for this structure cost fifteen per cent. less than it would have under the old conditions. One of the bidders on the Hall of Justice of Los Angeles offered a reduction of fifteen per cent. in his bid if the Institute's Standard Specification was used.

William Gompert, the architect of the Board of Education of the City of New York, has stated that a saving of \$540,000 would have been affected had the Institute's Specification been applied to the school buildings contracted for in 1924. Figured at six per cent., there is an un-

necessary annual interest charge of \$32,400 that must be paid by the citizens of New York to all eternity. That is in addition to the initial waste of over half a million dollars.

Notable as have been the economies affected in the last few years there is no lack of opportunity for progress in the same direction.

There are still many cities in which varying or obsolete building codes hamper the effort to eliminate waste, and make impossible the most intelligent, effective and economical use of materials. At the present time Chicago specifies a live load of fifty pounds per square foot for all floors of office buildings, while Philadelphia has fixed the load for such floors at 100 pounds per square foot. There is no logical explanation for the divergence.

The lost time and effort expended by the architect, engineer, and contractor can be still further eliminated by placing at his disposal additional tools for efficient work. With a view to aiding the men occupied with questions of design, the Institute is about to publish the final edition of a Standard Handbook of Steel Construction that will facilitate the labor of the designer by applying the Standard Specification directly to the product of the fabricating plant.

The tabulated data will also include information regarding all structural beams, channels, and girders used in bending, and complete information regarding allowable loads on rolled and built-up column sections. In general, the Handbook will contain, in readily referable form, information which it has been necessary to search through many volumes to obtain, or which it has been impossible to obtain at all.

Methods of fire-proofing are subject to improvement and lower costs. Wind stresses should be given intensive study. The influence of corrosion calls for further investigation, although the Institute has already financed an extended survey of buildings and bridges, erected more than thirty years ago, in an effort to discover any possible damage to the steel due to corrosive action.

In structures properly protected and given proper maintenance no damage was found. Colonel John Reed Kilpatrick, Vice-President of the George A. Fuller Construction Company, has stated that in his opinion modern fire-proof steel and masonry buildings, intelligently planned, competently designed, and honestly built, will prove capable of serving our great-grandchildren a hundred years from now.

The Institute has recently supplemented its preliminary investigation of corrosion by appointing a committee of experts to study the problem in all its aspects. It has requested the American Society of

Civil Engineers to appoint a similar committee in order that a joint committee, representing all interests, may work together and report at frequent intervals on its findings. This action was prompted by the desire to assure the greatest safety in the use of steel.

Safety in construction involves human life as well as the economic factor. The lives of the people are at the mercy of those who design and erect our buildings and bridges. Somewhere, every once in a while, a structure goes down. Some one has made a mistake. A loss of the investment is the inevitable result. Too frequently, this loss is rightly overshadowed by a sacrifice of human life.

No man should play a part in constructing anything upon which depends the lives of men, women and children, unless he is absolutely competent and responsible. The elimination of parts, or the use of inferior materials to reduce costs, obtain competitive advantages, or increase the rate of income, is nothing short of a crime against humanity.

A bill to promote structural safety is now before the New York State Legislature. If it becomes a law it will work hand-in-hand with the Institute's Standard Specification towards assuring greater safety in construction, while removing the barrier to structural progress set up by debarring competent men from using materials to their full advantage because others are too careless or incompetent to do so.

The degree of safety made possible by construction properly designed and erected has been illustrated by the effect of hurricane and earthquake upon various types of structures. In the recent Florida hurricane no steel-frame building erected in accordance with proper standards suffered anything but minor damage. Jerry-built structures went down like grass before the mower.

Steel construction has greatly decreased the menace of the earthquake. Steel frame buildings came through the Japanese quake with flying colors. Professor Bailey Willis, of Leland Stanford University and President of the American Seismological Society, has made the statement that the safest place during an earthquake is in a well built, steel-frame, building.

Oscar G. Knecht, structural engineer and City Building Inspector of San Diego, California, in his official report on the Santa Barbara earthquake, states that there was no damage to steel-frame buildings in Santa Barbara, and that the San Francisco earthquake proved the safety of competently designed and erected steel-frame construction.

Obsolescence causes an annual waste that runs into the millions. Statistics compiled by the Institute show that the average period which an office building

in the business center of a large city brings in an adequate return on investment is only twenty-seven years. Then shifting centers of population, or structural improvements developed since the erection of the building in question, cause the more desirable tenants to look at it askance.

Such a situation presents a challenge to the entire building industry. The challenge must be met. No country, however wealthy, can afford, for an indefinite period, to write off as a total loss great numbers of buildings after a service of less than three decades. The fact that in the majority of cases the structures are still entirely serviceable emphasizes the economic waste which their demolition must entail.

Due consideration should be given to the problem of obsolescence at the time when a building is erected. The owner and investor should keep in mind that the initial cost is not the whole story. The possibility of alterations or additions that will postpone obsolescence should be given careful attention. It should be remembered that in the event of demolition, salvage value is an important factor.

Within the last few years we have been gradually finding an answer to the problem so far as steel-frame structures are concerned. It has been found possible to convert such buildings to entirely new uses without altering the basic design of the structure. Other steel-frame buildings have been added to without disturbing the tenants.

Nine stories were recently added to the five story Bryant Park Building in New York while the tenants remained in possession. The addition has restored the building to its position as a source of profit to its owners. Steel bridges have proved equally adaptable to additions that, by increasing their capacity, have put off the necessity of demolition. When it is finally necessary to raze a steel-frame structure it has a high degree of salvage value.

The steel can always be used over again. One of the bidders on repairs to the thirty-four buildings wrecked last summer by the terrific explosion at the Naval Ammunition Depot, Lake Denmark, New Jersey, figured on some fifty tons of new angles, bolts, rivets, etc., but counted on shipping to the site equipment to straighten out the columns, trusses, and rafters.

A contract has recently been awarded for the removal of a thirty-four year old steel highway bridge over the Allegheny River at Pittsburgh, and its erection at Coraopolis where it will be adequate to handle the traffic of the smaller city. The span will be floated down the river on barges and submerged when passing under other bridges.

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

Twenty-three Years Without a Change

This "ANTI-HYDRO" formula for permanently hardening, waterproofing and damp-proofing concrete, stucco and cement mortar has stood unchanged for 23 years. During all this time it has been successfully used on every type of concrete hardening, waterproofing, acid, alkali, and oil-resisting work and has never failed to produce extremely satisfactory results.

Formula for using
Anti-Hydro for hardening
and waterproofing concrete

Being a liquid integral compound, "ANTI-HYDRO" mixes readily with the gauging water without the aid of skilled labor. It is easy and economical to use. It so enriches the concrete that one troweling is usually sufficient for a perfect finish. It also strengthens the concrete and accelerates the hardening of cement, thus eliminating costly overtime work.

"ANTI-HYDRO" is the oldest compound of its kind in existence. Use it on your next job for real, lasting satisfaction.

COMPO BOARD is
composed of three
parts:

Nos. 1 and 5 are a specially
prepared tough covering.

Nos. 2 and 4 are a strong,
waterproof cement.

No. 3 is wood slats, which
are thoroughly dried and put
together indiscriminately as to
grain.

CompoBoard

REG. TRADE MARK

Successfully used for walls and ceilings for over thirty years.
Insulates. Takes any decoration. Will not warp.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you should for insurance protection—and still running unsuspected risks.

It will cost you nothing to have your agent go over your property risks and your present protection. Perhaps he can reduce your insurance costs.

Your agent can give you dependable property protection.

Philadelphia Yesterday and Today

Northwest Corner 21st & Market Sts.

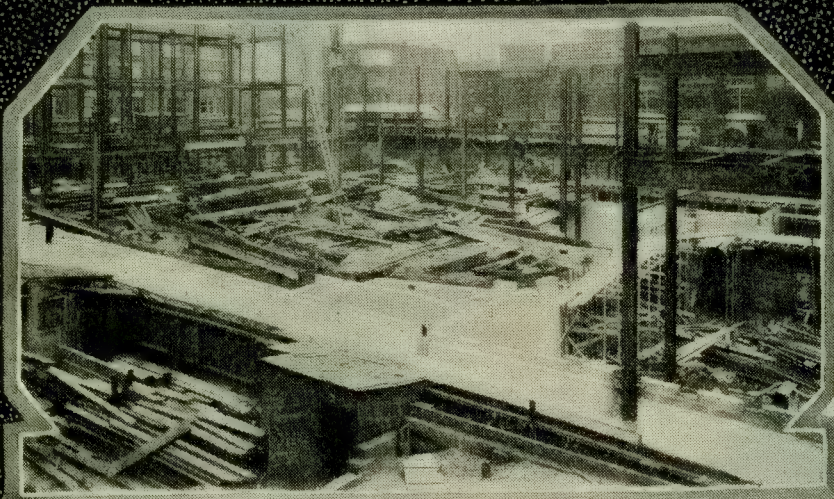

MANY will remember the old "Bradley Meat Market" which stood on this corner for many years.

Today on this same corner the beautiful "Erlanger Theatre" is nearing completion.

Philadelphia is indeed making giant strides to become famous for its architecture and buildings.

Co-operation is the watch-word of modern Progress.

The Annual Spring Outing of the members of the Philadelphia Builders' Exchange and Employers' Association will be held at 1.00 P. M., Wednesday, May 11, at the Manufacturers' Country Club, Orelan, Pa.

The grand prize, the J. Jacob Shannon Company Loving Cup, will come up for open competition at this time. The present title holder, P. M. Kearney, of the

office of the Architect for the City Board of Education, is ready to defend his trophy against all comers. Other members distributed throughout the trades, admit having an eager eye on the grand trophy. There will be other prizes for players less fortunate.

The Outing will follow the usual plan. Golf for golfers, baseball for the fans, quoits for the ringers, cards for the sharps, tennis and anything else you care to play. Everybody will have some diversion.

A good dinner will be served at six o'clock, followed by an entertainment at seven-thirty. You know the reputation of the Manufacturers' Club for delicious dinners, and surely you will leave the entertainment part in the hands of the Committee.

Tickets will be \$5.00 each, covering the entire privileges of the Club except for the customary green's fee. Members should make reservations just as early as convenient because no tickets will be sold at the Club.

PROGRESS OF BUILDING INDUSTRY DEMANDS ELIMINATION OF WASTE

An Address by CHARLES F. ABBOTT, *Executive Director, American Institute of Steel Construction, Inc., 225 Madison Ave., New York City*

(Continued from last week)

Speed of construction is an important element in the costs of building. Every day lost, whether due to weather or other causes, means a direct increase in costs which must be borne by someone, and an indirect loss of revenue that would be realized were the structure in operation. Damages assessed each year for delays in completion amount to an enormous sum.

Material which permits speedy and economical construction during all seasons of the year is an invaluable asset to owner, builder, and labor. The worker's dread of seasonal unemployment is

one of the heaviest contributors to human discontent, distrust, and ill-will. Demands for what may seem exorbitant wages, and deliberate slowing down of work, are frequently actuated by the worker's knowledge that he will probably have to struggle through black periods of unemployment during which everything will be coming out of the family cash reserve and nothing going in.

Such a situation causes an annual loss of \$100,000,000 in the purchasing power of labor. Added to this is the loss through tied-up capital, idle mills, idle equipment, idle factories, and idle carriers.

Fortunately the use of steel for construction purposes is tending to abolish the seasonal fluctuations in building. Winter building with steel has become both safe and economical. As a matter of fact, winter costs are frequently less than summer costs. Better prices can often be had on materials. Better service can be secured from manufacturers who are not over-taxed by the summer peak. Labor costs are less, since efficiency is increased by the desire to hold the job.

As for actual speed of construction, disregarding the influence of the seasons, powerful hoisting machines, recently developed, are permitting the handling of larger, and consequently fewer, units of structural steel. Pneumatic hammers make their assemblage a quick and easy matter. The Salmon Tower in New York affords an example of the speed made possible, throughout all the seasons of the year, by the use of steel for construction purposes.

On June 25, 1926, work started with the demolition of twenty-nine buildings. On November 22, 1926, rising skyward, were five stories of steel frame-work. Construction is steadily progressing throughout the coldest months of the year. By April 1, 1927, a thirty story office building will be ready for occupancy.

Traffic congestion in our large cities results in a tremendous waste of time, and high costs for the transportation of merchandise. Because of the crowded

Park 4981

condition of the streets, a speedy and powerful motor truck is often no more efficient than a horse-drawn vehicle. If time is money, as it assuredly is, the waste of the individual's time, spent in jammed subways or crawling motors, runs into an almost incalculable sum.

There rests upon the construction industry an obligation to co-operate in the solution of the traffic problem. If the industry does not co-operate, and encourage serious study of the subject, it is likely to be handicapped by hastily evolved theories enacted into laws.

The suggestion that the limitation of building heights will automatically relieve traffic congestion is a case in point. Such a limitation would greatly delay the development of the skyscraper, America's distinctive contribution to the building art. It would deprive the architect, the engineer, and the builder of one of his most important sources of income. So far as any real student of the situation has been able to determine, it would increase rather than decrease traffic congestion.

The skyscraper is the most efficient building known to man. It concentrates beneath one roof a large group of business men and women who have quick and easy access to each other. Vertical transportation within the building, by means of elevators, is more rapid, more efficient, than transportation on horizontal streets can ever become.

We are entering upon a new era of municipal transportation in which such vertical circulation within tall structures will more and more tend to replace pedestrian and wheeled traffic on the streets. There are, however, definite steps which should be taken to relieve the admittedly bad traffic conditions in our great centers of population.

Two-story streets may sound visionary, but some are already in use and others are planned for the near future. In New York City borings are being made for an elevated motor highway that is to run for four miles along the North River between Canal and Seventy-second Street. The roadway will be five feet wider than Fifth Avenue, and will make it possible to cover the distance in ten minutes or less.

It would be a comparatively simple matter to construct all future buildings in the business centers of our large cities with a view to ultimately cantilevering sidewalks from the second story level. This would make it possible to broaden the present streets by the width of the sidewalks. Still further breadth could be given by arcading within the building line. Space would thus be provided for parking, or for loading and unloading.

The use of steel for the frames of residences promises substantial economies for the home builder and a reduction of

the fire hazard. The practicality of the steel frame house has been proved by the erection of such dwellings in various sections of the country. Ten houses of steel-frame construction are now planned for erection in Nassau County, New York.

At the present time no comparative costs are available, but as the steel shapes are standardized and turned out in large quantities, the costs of production should be greatly decreased. The Jones & Laughlin Steel Corporation, with their Junior Sections, the Massillon Steel Joist Company, and others are now producing steel for residence construction.

As for the effect upon the fire hazard, seventy-five per cent. of all residential fires have their origin in the basements. If steel, combined with metal lath and fire-proofing materials, were confined to the first floor alone we would wipe out a greater part of the fire loss and eliminate another source of economic waste.

Sales methods more or less in vogue in the construction industry frequently carry with them an impairment of service or unwise selection of materials—both of which increase the burden of costs that must be carried, in the end, by the public. The Institute has always emphasized the necessity of the one-price system, and the selection of building material with due regard to the special use to which it is to be put.

To sell at cost, or less than cost, is not business. It is suicide. The price cutter sells at an inadequate profit, or at no profit at all. His competitor follows his lead. The buyer finds himself receiving an inferior product or inferior service. The customer gets what he pays for, and no more. The industry, the seller, the buyer, and the public suffer.

The Institute discourages any attack upon competitive materials. The salesmen in the structural steel industry are able to admit the features claimed by the manufacturers of competing products, and are able to supplement this admission by pointing out the following fourteen features possessed by steel alone:

1. STRENGTH

Steel is the strongest material in commercial use. A mass of steel could be $3\frac{1}{2}$ miles high before it would crush under its own weight. A steel chain suspended vertically could be 18,000 feet long before its weight would break the top link.

2. SECURITY

Steel is the most homogeneous material used in construction. It is manufactured under constant inspection and with adequate plant facilities. Large molts and representative tests insure its uniformity. After approval at the plant its constituents and properties can be relied upon. The known characteristics of steel are frozen into it during the cooling process, where they remain constant under all

ordinary conditions of climate and handling.

3. NON-LOCAL

The quality of structural steel manufactured in the United States and Canada is practically uniform regardless of the raw material and labor employed.

4. NON-SEASONAL

Steel can be erected under any condition of weather without protection against varying climatic conditions.

5. FOOL-PROOF

Steel can withstand more abuse without injury than any other structural material.

6. WEIGHT

The deadweight of steel is less per unit of strength than any other construction material.

7. COMPACTNESS

Steel occupies less space per unit of strength than any other construction material.

8. SPEED OF ERECTION

Steel construction requires less time and thereby permits more immediate returns on land and capital.

9. INCOMBUSTIBILITY

Structural steel will not disintegrate except at very high temperatures. It requires no more fireproofing than do the bars used to reinforce other materials.

10. DURABILITY

The permanency of steel is fixed. By a simple process of protection against corrosion and electrolysis its life becomes unlimited.

11. RESISTANCE TO SHOCK

Steel combines greater strength with higher elasticity. For use in regions affected by earthquakes or severe wind storms it has no equal.

12. ADAPTABILITY

Alterations in a steel structure can be made more readily and at less expense than in any other form of construction.

13. SALVAGE

If a steel building is to be replaced the cost of demolition is moderate while the salvage value is considerable.

14. RESPONSIBILITY

Steel is produced and fabricated by concerns whose large investments would not permit them to jeopardize future business by furnishing inferior material or workmanship.

The Institute is strongly desirous of co-operating to the greatest possible extent with municipal officials, building committees, and other representatives of the public in whose hands rests the decision as to the material to be used for a given construction project. The Institute recognizes that such representatives are frequently without technical training or any special knowledge of materials.

*"The Oldest
American
Fire and Marine
Insurance
Company"*

The Building Business is One of Risks

At the best, the builder has a lot of responsibilities. But the fire risk is one that he can shift to other shoulders.

Builders' Risk Insurance protects him from monetary loss by fire while a building is under construction.

Your agent will be glad to tell you without obligation, the advantages of these policies.

Insurance Company of North America

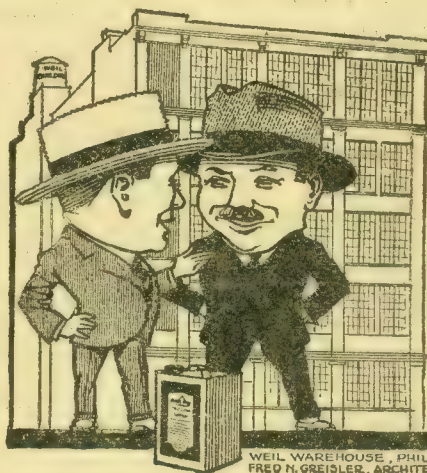

PHILADELPHIA

and the

*Indemnity Insurance Company of North America
write practically every form of Insurance, except life*

This Warehouse is Always Dry—It's Waterproofed with "ANTI-HYDRO"

Insurance companies give a lower rate to warehouses with waterproof floors than those without them. By using "ANTI-HYDRO" you can guarantee waterproof floors and the saving in insurance premiums for your clients, and at the same time give them absolutely hard, dustproof floors.

"ANTI-HYDRO" is a liquid integral compound, extremely easy to use. Any unskilled laborer can mix it with the gauging water. One troweling is usually sufficient for a perfect finish when "ANTI-HYDRO" is mixed with the concrete. It also accelerates the set of cement, eliminating over-time work.

Twenty-three years of continuous use assure you of complete satisfaction from every "ANTI-HYDRO" installation. Use it on your next job.

INSURANCE IS AN ECONOMY

only when it is rightly applied.

You may be paying more than you
should for insurance protection—and still
running unsuspected risks.

It will cost you nothing to have your
agent go over your property risks and your
present protection. Perhaps he can reduce
your insurance costs.

Your agent can give you dependable
property protection.
